The Amazing son in law Chapter 8075

Capital worldwide, from nations, conglomerates, and hedge funds to individual investors, is essentially driven by profit and price increases. During the rise of gold from $500 to $1200, which phase saw the most people buying in? Not the 500-600 range, but the 1100-1200 range.

How did these people enter?

By buying gold.

And where did they buy the gold?

Naturally, from those who already possessed gold.

In other words, most people entered when gold was between $1100 and $1200, using their money to help those who entered earlier cash out. Those who entered early made a fortune, and when the price eventually fell to around $700, it had little impact on them.

The stock market is similar.

Wu Yongzhen also hoped to be one of the lucky early entrants, investing his funds in the AI field. He planned to exit smoothly when the Rothschild family aggressively drove up AI prices and retail investors entered at high prices, thus reaping huge profits in a short time.

Having already succeeded twice, he had complete faith in the Rothschild family.

Moreover, AI is currently the hottest field in society. Although he doesn't understand AI very well, he sees AI-related news every day, and he even knows that the infamous anti-human AI Dalio is about to go public. So he almost immediately decided to go all in on AI!

The information Rachel provided indicated a timeframe of only one month.

Within a month, there would be at least a 50% profit, and the scale was so large that his small amount of money was simply insufficient.

Thus, he uncontrollably thought of two things.

First, embezzle public funds from the Qing Dynasty's anti-corruption association. Since he could earn a huge profit within a month, he could hand over the principal, and the rest would be his profit.

Second, leverage. A 50% increase in the overall industry doesn't mean his maximum profit margin is 50%. This is true without leverage, but with leverage, it's a different

story. A principal of 10 billion US dollars, plus another 10 billion US dollars in leverage—that's double leverage. If it increases by 50%, he'll earn 100%!

Of course, double leverage means double the risk.

With a principal of 10 billion US dollars, a 50% loss leaves 5 billion. However, with 10 billion US dollars in principal plus 10 billion US dollars in leveraged financing, a 50% loss means everything is wiped out.

If he were investing himself, Wu Yongzhen certainly wouldn't dare use leverage.

But things are different now!

He has insider information from the Rothschild family.

The Rothschild family's strength and authority are undeniable, and their reliability has been perfectly proven in the previous two instances. So, what is there to fear?

He immediately made a decision: to use all his assets, along with all the funds currently held by the Left Army Commander's Office, to double-leverage and go all-in on AI industry stocks and AI-related ETFs. He believed

he had to seize this once-in-a-lifetime, epic market opportunity to achieve true financial freedom. Little did he know, what he perceived as an epic market was actually an epic short-selling operation!
