

the Amazing Son In Law Chapter 6954

“The core assets of the Rothschild family, like those of the Rockefeller family, are mostly in the energy and resource industries;”

“The technology industry may have unlimited opportunities in the short term, but some areas may soon be eliminated by other new technologies. We warriors have no natural advantage in these areas. Who can guarantee that we will always be at the forefront? Maybe if there is a slight change, we will lose everything. You invest \$100 million in a technology project, but in the end you may not even get a million back. But if you spend \$100 million on a few oil wells, it will most likely bring you \$1 billion in revenue in the next 30 years. This is the importance of stability, and shock resistance is also an important indicator. If there is a world war tomorrow, I don't know if chips and smartphones can still make money, but oil, steel, and non-ferrous metals will definitely make more money!”

Although Sara is an old woman of nearly 400 years old and does not have a modern business mind, she is conservative and has established an unshakable core concept for the business empire of the Poqing Society through her understanding of the world over the years, which is to try every possible means to control as much energy and resources as possible.

As a witness of the Industrial Revolution and World Wars, she knows very well that no matter how the world develops, coal, oil and natural gas will still be the main energy sources for a long time in the future. No matter how world technology develops, whether it progresses or regresses, steel, precious metals and non-ferrous metals are also the top priorities of industrial society. Even if a world war breaks out and the world is turned into a wasteland, and all global technology companies go bankrupt, energy and resources will still stand.

Because of this, oil fields and mines accounted for the majority of the assets accumulated by the Qing Society over hundreds of years.

Of course, there is another very important factor here, that is, no matter where in the world, oil fields and mines are easier to carry out concealed construction projects and hide large populations.

The copper mine in Cyprus expanded the internal tunnels and working faces and built an underground community underground. Because it is a mine, this huge project can be completely concealed from the public.

Andre probably understood Wu Shutong's point of view and sighed: “After listening to what the Grand Commander said, I realized that I was just daydreaming.”

Wu Shutong chuckled and looked at the countless oil pumps below, and said with emotion: “The simpler the business model, the more reliable it is. Look at these pumps.

Every time they turn, they will pump up a large amount of oil that can be exchanged for US dollars. These machines run 24 hours a day. We just need to connect the extracted crude oil to the pipeline and transport it to the port. Those oil merchants will use tankers to transport the oil to all parts of the world. All we have to do is wait here and count the money. We don't have to worry about what will be popular today or tomorrow, and we don't have to worry about who will use technological innovation to destroy our jobs. Before those scientists figure out controlled nuclear fusion, there will always be money to be made here."

Andre nodded heavily and sighed: "The Anti-Qing Society has been able to stand firm in the world for four hundred years, which is inseparable from the foresight of successive leaders."
