

Lord of War 26

Chapter 26: .Strengthening equipment (two)

In the abrasive tool of the long sword, there is a handleless sword body lying quietly. The body of the sword is covered with a thin layer of green film like gum, which perfectly wraps the entire body of the sword and emits a light. The light blue brilliance, there are faintly shining stars.

Shaun, he has removed the hilt and the blade of the Charles Sabre, leaving only the body of the sword.

I saw him carefully cut an opening in this layer of film, and then the rock potion in his hand slowly poured from this opening. Suddenly, the light green film seemed to be irritated. The film on the sword body produced countless bumps, as if the entire film would burst in the next second. If ordinary people see this situation, they will inevitably stop pouring liquid into the film, but Sean does not stop, but starts to accelerate the pouring of liquid.

At this moment, in Sean's sight, he can clearly see a spectrum chart displayed on the sword body. The leftmost part is green, the rightmost part is yellow, and there is a red part of the spectrum chart. The pointer is staying in the white position in the middle—if you compare this spectrum to a ten centimeter long ruler, then the leftmost two centimeters are green, the rightmost two centimeters are yellow, and only the middle is less than The area of five centimeters is white, and the others are black.

If this kind of strengthening magic can maintain the pointer in the white area in the middle, then it can successfully maintain the strengthening effect, and if the pointer runs to the far left or the far right, then it means that the composite failure can only retain one of the effects. , Of course, if you let the pointer run to the black area, then it will naturally fail.

So even if the film on the sword body fluctuates strangely, as long as the pointer does not deviate, Sean does not need to bother at all.

His hand was very stable, without a trace of tremor, and the light yellow liquid poured out of the potion bottle reached an astonishing level—it was a long light yellow thread like a silk thread, and all the liquid followed that. The slits flowed into the film without any splashes, nor did the thread become thicker or thinner due to the gradual decrease of the liquid in the bottle.

Sean has been keeping an eye on the changes in the spectrum. Although he hasn't made equipment for a long time, these basic contents seem to have become a kind of physical instinct of him. It

doesn't need too much thinking at all, just a little. After reminiscing for a while, I remembered everything clearly.

Soon, all the liquid in the bottle was poured out, and there was nothing left.

Shaun glanced at the spectrogram, still staying within the white range. Rubbing his sore right shoulder, he couldn't help but laughed: The first time I tried the compound enhancement of the six attributes was much more difficult than it is now, but I haven't been so nervous. On the contrary, I am nervous now.

shook his head and expelled the fatigue in his mind. Xiao En could find that his face must be very pale without looking in the mirror. There is no difference between using life skills and using combat skills. Of course, as a blacksmith, what you need to consume is energy and stamina. If energy or stamina is insufficient, then all life skills will be unavailable, in other words, see. If there is no spectrogram, it will even cause a certain degree of influence on other aspects.

Shaun glanced sideways at the furnace. The flames in the iron barrel had become very small. He operated the mechanical arm to take the iron barrel and took a look, and found that the raw ore inside had melted into molten iron, but the oxidizer was not enough. The effect is still in play. This didn't matter. He took out another bottle of alchemy potion, the liquid inside was dark blue, and when the cork was opened, a light-colored mist appeared.

Extinguishing agent.

A very strange alchemy potion, its only function is to make the effect of the combustion-supporting agent disappear, except that even ordinary flames can't be extinguished.

Originally, after this step, it is necessary to carry out purification. The smithy also has corresponding purification tools. This is a very labor-intensive and time-consuming activity. Of course, Sean would not do this kind of thing at this time. He took out another medicine that had been prepared long ago and poured it into a slightly smaller iron bucket. There is a layer of clear and transparent liquid.

Purification potion, an alchemy potion most often used by blacksmiths, is slightly expensive. Generally, such extravagant things are definitely not used to make ordinary equipment. Only when making magic equipment, this expensive potion is used in a hurry. If it is not in a hurry, Sean will not be willing to use purification. Potion, this is an expensive potion for a gold coin!

After the flame of the combustion-supporting agent in the iron bucket was completely extinguished, Sean poured all the molten iron into a small iron bucket containing a layer of purification agent. As soon as the bright yellow molten iron entered this iron bucket, The color is lighter in an instant, but it looks like a more solid vision, and the potion of that layer of purification potion was originally only a thin layer, but now it has increased a few centimeters in height, and there are many inside. The colors of the finely divided black particles are even more mixed.

Xiao En stretched out his hand and took out the mottled layer of liquid and threw it directly into the furnace to burn it. He didn't want to leave any evidence here. After that, he stretched out his hand again to smooth out the crack in the sword body, and the appearance of the sword body was no longer visible in the pale green film, and some were just pale yellow. Through the operation of the mechanical arm, Xiao En repeated the previous action of pouring the rock potion again, and was still very careful and very careful to pour all the purified molten iron into the mold with the blade, so that the molten iron and the film Completely combined.

But this time, the spectrum in Sean's field of vision is no longer green and yellow. It is also shaped like a long ruler, except that the end is blue, and the top is red. As for the original middle white position. It turned into green, and there was no other color. At this time, the pointer on this spectrum is floating in the red area and is infinitely close to the top position. Whenever the pointer is about to reach the red top position, Sean will stop his movements and wait until the pointer drops slightly. When it comes down, the molten iron will continue to be poured into the mold.

In this spectrum, red represents high temperature, blue represents low temperature, and green represents perfection. When the molten iron is poured, a countdown will appear. If it is a casting weapon, you can omit this step and don't need to pay attention to it. But it's not for magic equipment. You must let the pointer drop to the green area before the countdown ends, otherwise If so, the final result of the forged magic weapon will appear in two situations.

If the pointer stays in the red area in the end, it will hurt the performance of the weapon. In the game, there were players who forged powerful silver that was worse than the medium-effect bronze attribute; and if the temperature was too hot, the pointer stayed at the end. In the blue area, the durability and quality of the weapon will be greatly reduced, causing the weapon itself to be relatively brittle, and it is even possible that some weapons of better quality will be cut by the opponent.

Although these failure experiences are the result of the game, but Sean does not want to try the real situation at all.

He just glanced at the countdown, then lightly took out the cooling spray that had been prepared, and started spraying the molten iron in the mold. This spray is also very tricky, because as

time goes by, the pointer on the spectrogram will gradually drop. If the cooling spray is used early, then the pointer will definitely drop to blue when the countdown ends. Near the area, this will also affect the equipment.

This step is one of the two dangers that enchanted equipment needs to face. The more advanced the enchanted equipment, the smaller the green area. The green area of special-effect gold-level enchanted equipment is less than one millimeter. The small line, that requires extremely precise judgment and mastery to achieve perfection. There were so many special effects gold-level magic equipment forged by Sean in the game, but only one reached the perfect standard.

Of course, only this step is still not difficult for Sean. He easily judged the descending rhythm of the pointer, and finally let the cooling stay in the green area.

The two most dangerous stages for many people are nothing to Sean, at least before the gold level, Sean can't make Sean frown.

He turned the abrasive tool over, poured out the long sword inside, then clamped it with pliers, took a medium-sized hammer, and slammed it down on the sword.

"Ding"

The hammer fell on the upper end of the sword body, and a light green halo with light yellow radiance bloomed from the place where the hammer fell. The rich wind and earth elements instantly diffused from the air, and The place that has been hit by the hammer is obviously flattened a bit.

After that, there was a series of tinkling sounds, and Sean took the medium hammer and hit the sword body all the time, no more, no more than exactly eighteen, which happened to be the eighteen greens marked by the spectrogram. light spot. Basically, every time Sean taps, a corresponding green light spot disappears and then turns red. After eighteen taps, the spectrum revealed on the sword has completely turned red. There are no other colors.

Basically after this step, even if the strengthening of Charles Sabre is completed, Sean clamped the sword body with pliers and placed it in the sink. A burst of white mist suddenly erupted, but the elemental aura that was originally diffused in the air was also As if attracted by something, it crazily poured into the sword body, but within a few seconds, the elemental aura that was still in the room disappeared without a trace.

Because of the use of purification agents, this sword no longer needs to be beaten and quenched repeatedly to remove impurities, which can be regarded as a one-time molding. After completing this step, Xiao En then re-embedded the sword and the hilt back, and the long sword immediately radiated blue brilliance again, but it was obviously more dazzling than before, even with the brilliance. There are a bit of green and yellow.

【Charles' saber (unopened), weak demonization (bronze), hardness? ? ? ,
Sharp? ? ? ,puncture? ? ? ,? ? ? . 】

【Item description: This is the saber bestowed by King Elder III of the Kingdom of Celian to General Charles on the eve of the outbreak of the Battle of the Northern Cold. This sword followed the life of General Charles, and was once regarded as a symbol of honor for the family of General Charles. However, afterwards, the sword lost its whereabouts because of the internal fighting in the family of General Charles due to inheritance rights. Now although you are lucky enough to get this saber, the magic power on it has been lost too much, and it has long lost its prestige. 】

"Next, as long as you polish and open the front, the data will be displayed." Shaun took the saber in his hand, and felt that the weight had increased a little, and his eyes suddenly became a little more expectant, because it was. The forging he tried for the first time after he came into this world, it seems that the effect should be pretty good now.

Thinking so, Xiao En walked towards the only grinder in the smelting room. He couldn't wait to see what the properties of this weapon were.
