

## M Factory 611

### Chapter 611: The leader came in person.

That night, in Amano Heavy Industry, there were several things that ordinary employees did not know, and which even surprised management, especially when Zhang Yutian summoned all of the company's engineers to accompany him to the lab and announced at the same time that without his order, no one was allowed to go to the mechanical lab to disturb them.

This investigator was also invited by Zhang Yutian and integrated into the engineering team as an assistant. This man knew very well what to do, upon hearing that Zhang Yutian was soliciting for him, he immediately gave a look of gratitude and expressed his willingness to seduce the boss.

If the engineers did not agree with him, they wouldn't express what is going on in their heads, Zhang Yutian will not allow them not allow the investigator to participate in their meeting, and he will not let him hang out outside. If they didn't do things the way he wanted, an accident could happen and take away his happiness when tomorrow arrives.

Of course, the most shocking for many directors is that tomorrow morning the boss of Anqi Heavy Industry comes to inspect the Amano Heavy Industry subsidiary; he is the legend who created Anqi Heavy Industry!

In the lab, Zhang Yutian and a large group of engineers sat in front of a large multimedia screen, staring at the content. Engineers who were proficient in software drawing handed over drawing and modeling urgently. On the large screen, we find a device model with an appearance close to a triangle and a slightly raised top, which rotates. The lab was extremely quiet, only the sound of engineers typing quickly on their keyboards is heard.

However, as the mechanical model built and filled in this equipment piece by piece, more and more engineers began to open their mouths and gasp. The model of the device in front of them was the most sophisticated they had ever seen, and it was also the most creative. He subverted everyone present to understand the concept of mechanical engineering.

After a long period of surprise, an engineer wearing glasses sighed and spoke: "There is no description of the shell material of the magnetic generator element in the drawing, but from experience, we shouldn't be able to make this material."

"The shell material is sintered with powder metallurgy technology. Similar technology can be found in ionization purifiers," Zhang Yutian said with determination: "Now is not the time for you to sigh. It is necessary to overcome all the difficulties and build the first test prototype. ~ We have technical drawings, as well as technical references for ionization purifiers which have been carefully researched. ~ Anqi Heavy Industry will also provide vigorous technical support since it has the world's leading high-precision processing technology. ~ I believe that since Monster Heavy Industry can produce it, we have to."

"Mr. Daisuke, with all due respect, Monster Heavy Industry's industrial technology is unmatched by any technology, whether it is Amano or parent company Anqi," An Amano Heavy Industry engineer retorted: "Take his magnetic generator as an example. The purity of metallic silver is fifty-nine after the decimal

point. Can Anqi Heavy Industry do this? Even though you can get the ultra-pure and as brittle metal as tofu, how can you wind it into a spool like in the picture?”

“Monster ~ Monster Heavy Industry, since it can do it, we can do it.” Japanese engineer Daisuke has a serious lack of tone.

“Don’t argue,” Zhang Yutian hit the table and said in a low voice: “I think everyone in the room understands the weight of these designs. I know the technical difficulty inside, but such set of sewage treatment equipment can sell for at least 200 million Yuan per unit price. ~ It’s technically difficult, so what?”

Indeed, after realizing the interest in this kind of equipment, all the engineers stopped talking about technical difficulties. Faced with a unit price of 200 million Yuan, even for a magmatic purgatory, they should try everything and experiment.

.....

The light in the room was on all night long, and the next day, when the sun rose and black turned white, and when the employees entered the building one after another, Zhang Yutian moved his body and returned to his office.

After watching the images on the screen intently all night long, Zhang Yutian’s eyes filled with blood, he paid close attention to the images projected on the screen. Right now he had messy hair, and the clothes are the same as pulled from a cow’s ass, his expression was untired at all, but there was a kind of excitement of a sample chicken blood.

.....

According to news received from the airport, the young president returned yesterday overnight and sent twenty Shanghai city security guards to search for his purse anywhere in Asashima Airport. The airport police station was also hit hard by these security guards.

The more anxious the young president, the happier Zhang Yutian’s heart became.

.....

Inspiration is, therefore, called inspiration because it is accidental. After missing it, remembering the original idea is as difficult as remembering the dream scene. Now Ye Qing has lost more than 20 drawings and manuscripts, and he could remember only three-thirds of them and Zhang Yutian considered him guilty and unable to reproduce these drawings.

More rewarding, after a night of technical discussions, they found it is not a fantasy to make a piece of equipment out of the drawings. If the first generation of wastewater treatment equipment is hellishly difficult, the second generation on the drawing is even more difficult. Perhaps this is the reason why the young president attached so much importance.

The first generation of wastewater treatment equipment was very difficult to manufacture. This point has been publicly explained several times by Monster Heavy Industry. After exploring the first equipment, they were stranded for six months before finding clues to small-scale mass production.

.....

In the eyes of Zhang Yutian, the rental but not selling method was mainly due to the lack of confidence in the product, and the greater improvement of the second-generation sewage treatment equipment shows that the difficulty of the technology of manufacturing was greatly resolved.

Zhang Yutian believed that in some details of the second-generation products, Amano could not reach the level of Monster Heavy Industry, but it was only 80 points of a 100-point gap, and as long as the passing line is crossed, the product can be launched.

At nine in the morning, Zhang Yutian and half of the company's management went to the airport to greet Taiichi Harada, the boss of Anqi Heavy Industry. There was no grand welcoming ceremony, and there was no powerful caravan. The old man, who could be considered a legend in Japanese business, rushed to the city of Asashima due to a phone call he received yesterday.

Taiichi Harada and Ye Qing met in the United States. On this side, Taiichi Harada chose to smile to express his kindness and friendliness. He was eighty-nine this year, and he's seen too many people and things. Long experience has made him realize that if a business wants to grow, it can only learn to compromise and cooperate. He was ready to cooperate with Monster Heavy Industry, but the young man was so ambitious he didn't care about the Americans.

"When I was young, I had the same idea as him." Taiichi Harada sighed, "But America taught me to be a man." Taiichi Harada wanted to live a few more years, he didn't think he will live until one-day Monster Heavy Industry goes to the US and the world's capital markets. When people are old, they inevitably come from their past.

When he arrived at the Amano Heavy Industry building, Taiichi Harada came to his senses and slowly walked into the lab with the support of Zhang Yutian. Looking at the three-dimensional drawing model on the screen, he was silent for a long time.

"Zhang Yutian, this is a huge challenge and an opportunity for us. ~ In terms of technology, I will use all our strength to support you. Even on the American side, we can also ask for their help. After all, the benefits of sewage treatment equipment are also part of their needs."

"Hi ~" Zhang Yutian leaned over a ninety-degree nail, saying categorically: "Please rest assured, Mr. Tai. I am very confident the company will help... "

.....

The next day, Amano Heavy Industry held a global press conference and published a piece of news that shocked the world... They made major achievements in industrial wastewater treatment technology, and related technical theories were verified. Shortly after, the first prototype will enter the test.

The White House immediately issued a statement... They are willing to cooperate with Amano Heavy Industry on environmental protection technology issues to accelerate the birth of the first prototype.

At the end of the press conference, Amano Heavy Industry, which has just been listed at the start of the year, its rating was raised in barely half an hour.

**Chapter 612: Amano Heavy Industry Co. Ltd.**

At the dawn of the New Year 2017, the Chinese people seemed to benefit from a satisfactory dynamic in the strong rise of their national manufacturing industry. First of all, the various products of Monster Heavy Industry have shown their talents internationally, and now Amano Heavy Industry is following suit.

.....

In the afternoon, the exterior of Amano Heavy Industry was packed with journalists from across the country. The company let it be heard at its press conference that it has started working with the United States and that its product even seems to be attracting interest from the Yankees.

This led to what most people thought since the United States was into this sort of thing, and then this thing is the best product out there. In addition, this time, US officials rushed to encourage Amano Heavy Industry. This led to the impression that Amano Heavy Industry would become the second giant heavy industry after the Monster Heavy Industry.

Some reporters also euphemistically asked the speakers at Amano Heavy Industry, saying: "Are your company's upcoming products mimicking the wastewater treatment equipment from Monster Heavy Industry?"

The Amano Heavy Industry spokesperson didn't care and replied: "The theory that ionization can absorb pollutants in water has always been around. Just like a car needs wheels to run, an airplane needs wings to fly. The products we are about to launch just follow this scientific theory, and there is no such thing as who mimics whom."

When the stock market opened in the afternoon, shares of the Amano Heavy Industry rose again. For a while, countless retail investors rushed to buy stocks and only waited for them to buy, then digitized their stocks and started waiting for a quick payoff of a lot of money.

"President, Mr. Burnhouse and Mr. Belsham invite you to dinner at the Haitian Hotel this evening. These two are the giants of America's high-tech industry. They are also partners presented by the director Lancelot of the environmental protection agency."

Zhang Yutian nodded uncontrollably while listening to the secretary's report.

The Americans have finally arrived, so the main technical difficulties of wastewater treatment equipment will no longer be a problem. And Zhang Yutian need only sign for the terms that prioritize the supply of the goods to the United States. This is the charm of cooperation, and Zhang Yutian was ready to cooperate with anyone as long as there is a benefit.

.....

In Shanghai City, within the Monster Heavy Industry, Ye Qing was in front of the computer, watching the news with a smile. Overnight, it seemed like Amano Heavy Industry was all over the internet and on TV. There was also an advertisement for their smart gym on the internet and on TV, and on the internet, many citizens discussed the news that Amano Heavy Industry has won fame for the country and brought in the Yankees to buy their products, and various news sites have also participated in making it very popular.

I have to say that Amano Heavy Industry was very good at using online media to build a dynasty. For example, when the Monster Heavy Industry held a press conference, they handed reporters a red envelope containing no more than one thousand Yuan, and when they encountered reporters who were not pleasing to their eyes it kicked them out of the place.

Amano Heavy Industry did not. Their press conference started with a red envelope of 50,000 Yuan. These top media reporters will also receive a generous amount of additional money. Therefore, wherever Amano Heavy Industry is on the move, the news on the internet can be overwhelming.

.....

Now, Ye Qing wishes could go to heaven and in order to more accurately reflect the mentality of an angry president who lost important information and did not know what to do, he coughed twice, adjusted his acting skills, and his mood, and dialed Zhang Yutian's cell phone number.

The phone had rung dozens of times before it was connected. Ye Qing opened up the conversation and asked seriously: "Did you steal the drawing?"

"Drawing, which drawing?" Zhang Yutian's acting talent was also very strong, in his voice full of astonishment and curiosity, he asked: "Mr. Ye, you can talk about this a little more clearly."

"I lost a drawing at Asashima City Airport. The subject of the drawing is your next industrial wastewater treatment system. Zhang Yutian, please stop your behavior immediately."

"Mr. Ye, I really don't understand what you're talking about." Zhang Yutian shamelessly said: "Ford mass-produced the world's first commercial assembly line car, but that hasn't stopped Volkswagen and Toyota from now becoming the world's largest auto-brand seller. Monster Heavy Industry has created industrial ionization wastewater treatment technology which is good. But with that, you can't stop other companies from investing money in research on similar technologies, can you? ~ If you think I robbed you. If you have any evidence, then Mr. Ye, go to court to sue me. If you have nothing more to say, I'll hang up first, Mr. Burnhouse and Mr. Belsham from the United States have already made an appointment with me for dinner."

Ye Qing smiled again at Zhang Yutian's busy tone on the phone. The two Americans he was talking about were both heads of well-known American industrial companies. It looks like Zhang Yutian's shares were faster to rise faster than he thought.

It is not difficult to understand. The designs are from Ye Qing. He is bound to race against time to manufacture the finished product first and ahead of Amano Heavy Industry. Because once they turn the contents of the designs into finished products before him, it will become their product, but in his heart, Ye Qing wanted to tell him: "There was nothing to worry about. The drawings are offered to you."

In the evening, the media power of Amano Heavy Industry's public relations again manifested itself. Numerous news media across the country have devoted significant time to their television news programs to report that Amano Heavy Industry is about to launch a revolutionary wastewater treatment system.

Although Monster Heavy Industry's wastewater treatment system is ahead, Amano Heavy Industry had no intention of competing with Ye Qing in China from the start. The series of reports disseminated by

the various news media is just to create an established fact in public opinion, the perfume is blooming inside the wall because we must not forget to say the people of Amano Heavy Industry have already signed a cooperation agreement with the US government, and as soon as the product is launched, it will prioritize the US market. At the same time, the White House spokesman also announced the cooperation with Amano Heavy Industry to introduce a new generation of industrial wastewater treatment technology by ionization. They planned to approve the pilot operation of eight treatment plants in two industrial cities and the Great Lakes.

As soon as the news got out, Americans boiled down the internet with their comments, since the press conference about the wastewater treatment system produced by Monster Heavy Industry earlier, which may have made them greedy. They went to the White House to protest online and went to the Environmental Protection Agency to complain savagely, but the government just pretended not to see them, and there was no movement at all. Now that the government has finally taken the step, even if it is not with the Monster Heavy Industry which saved hundreds of their compatriots, and as long as the wastewater treatment plant can be built to improve their living environment, they will no longer be so demanding to force them to specify which company to cooperate with, especially in the Great Lakes, where heavy metal pollution was particularly severe, the bellies of freshwater fish were completely black after being opened. If the Great Lakes will be cleaned up, the American people will absolutely support the idols and support the re-election of President Donald Trump as president.

At around the same time, Ye Qing had already arrived at the Longxitan factory to prepare for the first conversion of storage materials for plasma batteries. Now that all the materials have been prepared, as long as the converter is transformed, the first plasma battery will be on display before Ye Qing's eyes, and when Amano Heavy Industry collapses, that will be the very moment that Monster Heavy Industry announces a huge breakthrough in the energy sector and will make global headlines.

Walking to the underground base, next to the converter full of magnificence and technology, where there were already two Master Craftsmen waiting, in front of them was a row of empty plasma battery cases. They were shaped like a rectangular cookie, approximately the size of a textbook, two inches thick, and a transparent shell. It was a transparent multi-layered polycarbonate shell made of organic compound manufactured by Master Metal Expert.

Although it is not a metal, it had better properties than ordinary metals. Modern fighter aircraft cockpits used similar transparent materials.

"Boss, I'm just waiting for your order," the Master Craftsman raised the lever in his hand.

"Yeah ~ let's get started," Ye Qing took out the data glasses and put them on, telling Master Qiao he could start the converter.

During processing, there will be a strong current bombarding the material. Wearing glasses can prevent the strong light from breaking through the eyes.

### **Chapter 613: Manufacturing plasma battery.**

Under the command of Ye Qing, the Master Craftsmen immediately began the work of the transformation.

"The material has been detected correctly, and the bombardment will begin."

A cube, made up of various metal compounds and chemical elements, was sent to the converter bombardment chamber. This cube was extremely dense and had a silvery gray crystalline structure on the surface. Looking through the transparent observation window of the bombing room, this cube was like a metal jewel placed in a display case, revealing a sense of mystery and science fiction.

Seeing everything was ready, Ye Qing subconsciously stepped back. He had made this movement by a pure reflex, and he had done it without thinking about doing it, it was an act without consciousness because the movement of this process of transformation is not going to be small.

“Countdown, 3 ... 2 ... 1 ...”

With the countdown, the converter with four huge amplifying devices instantly roared, and the sound of electric current sounded loud while dancing, and when the countdown disappeared, the bombing room had been hit by four lightning bolts dazzling. The material of the silvery gray crystal structure was instantly lit, shining like the sun, and the entire underground base was white. Even far away, Ye Qing could feel the enormous energy contained in the bombing room.

The scene in front of him surpassed the technology of that time because there was no solid material left. The cube was able to withstand a discharge of two hundred kilowatt-hours per second. In addition, these two hundred kilowatt-hours were boosted by four boosters.

Under the bombardment of the terrifying electric current, the materials in the bombing room gradually changed from warm white light to a puddle of blue light, and when the current stopped, the dazzling light dissipated, and the original solid material became a liquid, just like the mercury, and the surface glowed with a clear blue light, becoming another group of substances.

The technology was so magical the most common carbon structure could be turned into diamonds with the help of technology. The equipment in front of him could use even more incredible means to turn metallic crystals into liquids at room temperature.

The plasma battery case with a diaphragm in the middle was also inserted under the converter bombardment chamber, and when this luminous liquid energy storage material was injected into the case, it was also announced that the first battery to plasma was officially over.

“Congratulations on having successfully manufactured the first plasma battery. A rewarding breakthrough has been made in the energy field.”

For a plasma battery, the energy density is 1200-1300 h / kg, with the characteristics of fast charging and low discharging, and the lifespan is 2000 times that of a cyclic charge.

Looking at the notification on Monster Factory’s phone, Ye Qing probably congratulated himself in his heart.

As a result, the energy density of the current plasma battery has reached eight times that of the Apple cell phone battery, the service life has reached four times with a powerful capacity of fast charging and slow discharge.

What is this notion?

Originally, with a normal battery, you can watch videos for six hours without recharging it, but if the plasma battery is applied to a mobile phone you can now watch for two days without recharging the cell phone battery, whether lithium batteries or nickel-hydrogen batteries are only suitable for slow discharge. And the number of charge cycles is between four hundred to six hundred times. It doesn't sound like much, but let's talk about it in a general way. The number of recharge cycles refers to the state where the battery is deeply discharged to the point where there is no more power, but when the battery power drops below 30 and the user will charge the battery, this will greatly extend the battery life up to two thousand times, and if the mobile phone is used until it is scrapped, half of the battery life can be left.

It was not a technological advance, but a complete peak. Ye Qing understood that once this type of plasma battery hits the market, it will shock the world and all battery makers will feel hopeless. The only problem is he was worried that the cost of the plasma battery would be too high and the production steps would be cumbersome.

Leaving aside the cost of the converter, the special case needed to produce plasma batteries and the materials composed of a variety of metal compounds and chemical elements cost more than two thousand Yuan, while the purification of materials is another amount of money loaded on its own.

Fortunately, Ye Qing could first launch a low-density plasma battery with low material purity for ordinary consumers. He and the high-end and complete version just have to sell it as a luxury, and the world lacked everything, but the local tyrants were not lacking.

Thinking about this, Ye Qing called Tianjin first.

The Watcher NO 3 series robots have been stuck for too long with energy issues. With the plasma battery, Ye Qing will be able to install more mechanical equipment, and the battery life will be able to reach one day. By the way, the Monster Heavy Industrial Building may also be equipped with such a backup energy system in the future.

.....

Let's go back to the topic. Monster Heavy Industry has completed the revolutionary breakthrough of its product and Amano Heavy Industry in the city of Asashima has mobilized all its forces to translate what it had stolen as drawings into a concrete object, moreover, Anqi Heavy Industry and two US technology companies have provided technical assistance, but even the construction of half of the second-generation wastewater treatment system is not yet complete. Multi-segment structures were manufactured in three countries at the same time, but now they have a huge technical problem.

In the building lab that was irrelevant, Zhang Yutian, shortly after attending the dinner, anxiously circled around the ring-shaped metal alloy. The alloy ring is about two meters wide. The outer surface and inner surface of the mirror are covered with gears with the same intervals, and there is a pre-hole for the guideline in the middle.

Just making the alloy bushings almost embarrassed them because the drawings indicated it was a non-magnetic alloy material and the high precision machined forgings with a diameter of more than two meters, Amano Heavy Industry could not produce it at all. In fact, not to mention Amano Heavy Industry, apart from Monster Heavy Industry no other Chinese company could do it, and since

international companies have several subsidiaries, and to find out who could handle it, Zhang Yutian called his father.

Fortunately, Zhang Yutian's father also received technical support for his parent company Anqi Heavy Industry. So the chief of the land who was about to enter the soil was solicited by the Japanese company Yamazaki Mazak who used his Zhenguo Heavy Industry equipment to process the forgings. Yamazaki Mazak was one of the world-class high-precision machine tool companies capable of producing the world's best industrial master machines with machining accuracy of 40 nanometers. This large alloy ring was made using its large industrial hen to be processed and demagnetized.

Now that the circle is in place, American industrial technology companies are also being rushed by airplanes, and they can purify metallic silver with the highest purity.

Everything was ready, and Amano Heavy Industry engineers were the first to come into contact with this high purity metallic silver. They were extremely careful, but they were never able to wind the stretched silver cable after heating and melting.

A single high conductor coil with a specific structure could release a highly qualified ionization position. The problem is, these silver cables are more fragile than tofu, so they made a circle to make sure they don't break. They tried all the methods to come to think and finally gave up the machines, and thought of calling in a master, the best craftsman to enter the battle, to carefully turn the fortune, turning the metal ring fixed on the rotary base purely by hand.

The master craftsman's record was two laps per hour, and the number of full spool laps was over 3000. If there was a break in the silver cable, it could be placed in an electronic heating oven and would send back in the oven to solder it. With the experience of winding the coil alone, this would bankrupt Amano Heavy Industry.

Zhang Yutian could not accept this fact; on what basis could Monster Heavy Industry do it? The technicians from the three countries have gathered here, but they are helpless. The technicians around, sitting one by one on the very clean floor, were full of grief and said nothing. Especially the technicians sent from Japan and the United States. Before their arrival, their hearts were higher than the sky. Now their beliefs have almost collapsed by the Monster Heavy Industry. They want to go home and start studying in elementary school again.

There is no harm if there is no comparison.

Zhang Yutian even had the idea to ask Monster Heavy Industry for help. It is never possible to ask them for help; he could only think about it, and much more! The helpless Zhang Yutian suddenly jumped up, looking nervous and excited: "Wait, last night, I, Mr. Burnhouse, and Mr. Belsham are having dinner at the Haitian Hotel. At that time, there was a soft tofu dish on the table. It was also extremely fragile, and the wands break them when we touched it. However, the chef used a knife to carve a dragon and a dragon's whiskers on this dish content and did not break it. How could the chef do this?"

The surrounding group of engineers heard what he had just said and suddenly looked up, they were even more excited than a prisoner who had been sentenced to life imprisonment and heard the statement of his sudden release.

The high purity metallic silver in their hands was as fragile as tofu, and it is theoretically impossible to roll it up successfully, but Monster Heavy Industry could do it, and yet a Haitian hotel chef was able to carve as well dragons and phoenixes on similar materials. Is there a link between the two? ...

Zhang Yutian quickly picked up the phone and called the Haitian hotel, and after calling his landline and turning around a few more times, he finally contacted the boss. Hearing the promise of a 100,000 Yuan reward, the chef spilled the mystery of a mouthful.

.....

Practice makes the person perfect, even sculpting in water.

.....

“In water?!”

The teacher who looked at the winding records excitedly said: “Yes, the water can simulate the state of weightlessness so that when the silver coil is wound up, the influence of gravity will be greatly reduced.”

“Use high purity distilled water, which can avoid contamination of the coil with impurities in the water.”

“Wait, is this doable?” American engineers asked: “Pure silver is easy to oxidize. Once in contact with water, the oxygen molecules will adhere to it...”

“Then use anaerobic distilled water. Once the equipment is coiled in water, put it in a container filled with nitrogen for dehydration.”

Zhang Yutian was as excited as Xinda 6. He felt that relying on his own wisdom; he had unraveled the mystery of the coiling of Monster Heavy Industry. Although these silver coils are extremely fragile, once they are wound on the non-magnetic alloy ring and attached, as long as they are moved carefully, there will be no need to worry about damaging the coils.

The biggest technical issue bothering them has been resolved, and Zhang Yutian wanted to share this good news with the world.

## **Chapter 614**

For the next two days, in the Amano Heavy Industry lab, the engineers who boarded the lab lived and ate in the business and were very careless, but stared at the platform in front of them with extreme excitement.

Zhang Yutian was also there, and the joy in his heart was beyond description when he saw the second generation of high-ionization wastewater treatment equipment in the drawing was finally made. It was simply made by a miracle!

Starting from simple drawings, Amano Heavy Industry used all of its public relations to gather all the materials needed for this equipment, and to seek help from a skilled craftsman, and to solve other problems, they called on a dozen of the best engineers from the three countries.

Amano Heavy Industry has paid an unimaginable price to finally build this second generation of high ionization wastewater treatment equipment.

Zhang Yutian looked at the triangular-shaped device, about two meters tall, and remembered all the things this week. He even felt so bitter he wanted to shed tears.

It was really to save time, whatever the cost. The material cost for this sewage treatment equipment has passed 100 million Yuan. Fortunately, all of these efforts have had a positive result and were not in vain.

With the experience of manufacturing the first equipment. Zhang Yutian was quite convinced that he will only spend 50 million Yuan in the future and rebuild the second in less time.

Whether it is Amano Heavy Industry or the parent company Anqi Heavy Industry, they have never dared to imagine that one day this product will be launched, and that supply will exceed demand as soon as it is put on the market but Zhang Yutian had done it, and since the press conference, the United States helped him build it.

Today, a large number of European and American countries have taken the initiative to contact Amano Heavy Industry to inquire about the production status of the equipment of the new generation of wastewater treatment. They just said over the phone: "For the price, that's what you ask for, as long as the product is guaranteed, and remember, you can prioritize us."

This kind of novel speaking made Zhang Yutian feel like swimming in the heavens like a fairy, as if the god of fortune approached him with a bag, patting his shoulder and saying: "Brother, the money is in it, you can take it if you want..."

"Thank you all, I will ask finance to give each person a 100,000 Yuan bonus later," Zhang Yutian did his best to calm his voice: "First of all, we will enter the testing session to find out if there are any problems during the testing process."

Everyone clenched their teeth and insisted.

"I promise that when the equipment goes into mass production, all personnel involved in manufacturing will receive a bonus for every product sold."

The circle of engineers waved their hands and applauded, and hurriedly punched the chest as if to carry out a military order.

Half an hour later, the engineering circle carefully moved the equipment from the lab to the Amano Heavy Industry factory.

Amano Heavy Industry is a full-scale large-scale factory, where electroplating, electrolysis, and water cutting are required for processing tasks that require water to participate in everyday machining. Naturally, a lot of wastewater containing important heavy metals is also produced. It turned out that this wastewater must be collected in a large wastewater tank for complex filtration treatment.

When engineers installed their latest product in the sump, a circle of people stood in front of the cesspool awaiting the judgment of fate. Zhang Yutian personally activated the system switch, then immediately took a few steps back.

"The ionization position is activated, the wastewater analysis will begin..."

"Twelve harmful substances have been detected and are being removed."

Not to mention too much, this whole sewage treatment system, which was modified from the ionization purifier chip, performed well in the first test. The results were unvulgar. This sewage treatment system was able to emit a purple light. Two hours later, in the gray industrial wastewater basin was collected a quantity of polluting products, and clear color of the water could be seen at the bottom of the swimming pool, and in the neighboring waste bucket, a half-bucket of muddy pollutants also accumulated.

After the water quality and test results were published, Zhang Yutian's expression of pride became stronger, and a series of smiles appeared on his face and said: "Secondary discharge standards, these waters treated waste can be directly discharged into rivers and lakes."

Among the crowd, Kenelm, an engineer from the United States, also took the report and studied it for a while: "Perfect. The heavy metal components in the wastewater have been 95% removed. don't know what the Monster Heavy Industry can do best and to what extent, but I know this product of ours has worked wonders. The American people absolutely need this product. Pollution is reduced to a number unbelievable."

"We, America first will have this product!" Kenelm gave the Japanese engineer a blank stare, who could only roll his eyes weakly.

The test lasted for three days and the engineers worked in two shifts to test it in every imaginable way of working. The results of the temporary tests made everyone proud, as this process only revealed a few harmless little issues.

The next morning, Zhang Yutian again held a press conference to make up for the long nights without dreams and to boost the business.

At the press conference, Zhang Yutian announced that Amano Heavy Industry produced the first wastewater treatment equipment. After rigorous and scientific testing, this equipment performed very well. In the next step, they will make more products and put them in the sewage treatment plant for trial operation.

At the same time, the United States Environmental Protection Agency also made a concerted effort and posted a statement on its official website. The statement first commended the achievement of Amano Heavy Industry's wastewater treatment equipment in the global cause of environmental protection. At the same time, they invited Amano Heavy Industry to bring its products to the US side for trial operation and testing.

As soon as the news got out, the world was in turmoil again. What is the origin of this type of wastewater treatment equipment? Hasn't Monster Heavy Industry also made it before? Why does his movement seem so much smaller than that of Amano Heavy Industry?

As soon as the news broke, Amano Heavy Industry shares, which had stabilized, had risen again after the market opened the next day!

The big good news will boost the shares prices of listed companies. However, the consecutive rise in shares, born out of high-quality shares, is simply more sensational than Amano Heavy Industry's announcement of the development of a new generation of wastewater treatment equipment.

If a share continues to stay at its daily limit, it will only be looked down upon by investors, and dealers yelling at its sale will again create problems.

But a 50 billion yuan company with its shares rising, its listed shares sold out, on consecutive days, and for a short period of time, that did not happen at all. Due to several daily limits, the market value of Amano Heavy Industry shares actually increased by half, reaching a scale of over 75 billion.

Combining all of these performances, the blind also knew Amano Heavy Industry was going to take off, and many media across the country also rushed to report the news. For a while, Amano Heavy Industry has had boundless beauty, and its popularity on the Internet is higher than that of Monster Heavy Industry.

Overseas media also profited from the fastest information regarding the sewage treatment system. Especially in these European and American countries. Monster Heavy Industry rejected their proposals on the grounds of meeting domestic market demand. Amano Heavy Industry expressed with admiration that it must first satisfy the global market. How can European and American countries not vigorously convey and convey to the public that the government has left no room in efforts to protect the environment?

Eight days later, the first set of upgraded purifiers and the subsequent emergency production of two wastewater treatment systems were quickly dispatched to the United States on a charter cargo flight.

.....

Pittsburgh, Lake Ontario bordering Canada and Phoenix, the state capital of Arizona. These three localities have become a lot of pilot towns and lakes.

Pittsburgh, once the steel capital, has gradually shifted to finance and medicine. But before 1980, it firmly held the throne of world steel production, and the heavy metal standard was especially severe in the city's major rivers. The favorable economy has made Pittsburgh one of the safest cities in the United States.

However, in the city, there are still several special steel makers who have survived, and the annual environmental governance issues have caused headaches for the local government. The ban was not enough: Even if the White House will overthrow its government to the end, it will be unable to ban companies that supply special alloy steel for warships and aerospace manufacturing from continuing to work.

Now their "savior" is finally here. When the batch of sewage treatment equipment arrived at the American airport, the scene was more awe-inspiring than the international superstar. Many TV stations competed to broadcast live, and countless environmental enthusiasts flocked to the airport to greet him.

"From now on, we will say no to water pollution!" The NBC news has scrolled this information on all the advertising channels.

#### **Chapter 615: Fatal defect in fermentation.**

Lancelot, the director of the Environmental Protection Agency, personally organized the handover ceremony at the airport. The ceremony was very simple. He signed the authorization with the

representative of Amano Heavy Industry, but after signing the signature, Lancelot seemed unable to get rid of the reporters in the airport VIP lounge without half a day's effort. After signing the documents, around thirty media outlets there surrounded him and began to interview him at this point. Previously, the driving force behind the Monster Heavy Industry was behind the scenes. Now, as long as all Americans in the United States who are online, know the power of the High Ionization Industrial Wastewater Treatment System. Before, when the video of the sewage treatment system was released on the internet, locals have gone to the government website one after another and urged the government to introduce this equipment to cities where pollution was high as well unbearable to search for a beautiful living environment, which is the wish of every citizen. At first, they thought the government was pretending to be deaf and not bothering to meet their demands, but it didn't take long for the government to welcome this extraordinary product to the United States!.....How will this information be able to excite residents concerned with the protection of the environment and the search for a clean living environment? Lots of people watched the news live which made them think this somewhat chubby man was especially cute when they watched Lancelot on TV, especially when he was repeatedly interviewed by the mainstream media. "Excuse me, Director Lancelot, what is the difference between this wastewater treatment system and the products of Monster Heavy Industry. It is said that to build this system, we also provided technical assistance, which means that we can also produce this equipment in the future. Is it true?" Director Lancelot was full of red. He swept away the baldness that had been ruthlessly rejected by Monster Heavy Industry, and that rejection caused complaints from citizens. After all, the public's bad impressions of the Environmental Protection Agency were too big before, and everyone was yelling at it. Now that he finally has a chance to wash his face and gain prestige, Director Lancelot must desperately seize the opportunity. Looking at the slightly smiling faces of the reporters and listening to the haste within them, with a relaxed tone, Director Lancelot smiled at the camera: "I think everyone understands the instructions for use of this water treatment system worn-out thanks to previous videos I was able to see from internet video data. I want to tell you that the principle of this wastewater treatment system is uncomplicated. The products of Amano Heavy Industry and Monster Heavy Industry have the same technical principles. This time, we have cooperated with Amano Heavy Industry to have this equipment and have the advantage of prioritizing its promotion in the US market. And this is something that Monster Heavy Industry did not want to give us.?" As to whether we can produce this equipment, it depends on the cooperation between the two parties later. When the conditions are favorable for both parties, it will naturally be authorized to produce this set of products in the United States. There is a great possibility to get to this point." The television audience suddenly realized that the government had already obtained permission to prioritize promotion in the US market. It seems that the government is still very powerful! "I think I have to apologize before the cooperation plan is leaked. I always complain about you in the papers that you don't pay attention to our living environment and I act with a bureaucracy." Another CBS reporter said with some shame: "Unexpectedly, you brought this equipment to the United States in less than two months. ~ Here, I sincerely apologize in public." Haha ~ Director Lancelot almost burst out laughing on his face. His heart was sweeter than honey. It is more difficult to excuse these journalists than to make politicians and parliamentarians tell the truth. "It's good, it's good." Director Lancelot pretended to be very humble: "Because it involves trade cooperation secrets, sometimes we cannot disclose certain details prematurely. ~ However, the general public, so concerned about environmental issues. a kind of supervision to our environmental protection workers and we are ready to accept that kind of supervision all the time." Even viewers have rekindled their confidence in the Environmental Protection

Agency and the White House. Moreover, no promise is as good as a good promise. The host of the television channel gave the audience a popular science. Usually, a plan of cooperation between two countries, from discussion to introduction lasts a year, which is already considered effective. But now that the wastewater treatment equipment can be set up in less than two months, it shows the US government has gone to great lengths to make it happen. After the signing ceremony, the three wastewater treatment systems flew directly to the United States, then they will go to three different destinations. At two o'clock in the afternoon local time, Pittsburgh took the lead in inaugurating the world's first wastewater treatment system. The system will be located near the mouth of the Ohio River, which is Pittsburgh's traditional industrial zone, although Pittsburgh has phased out many polluting steel companies. But there are still several well-known steel companies here, for example, U.S. Steel, Westinghouse Electric, Alcoa, etc. For these companies, in particular, the most polluting is Alcoa, and the local government loves and hates them. The local government loved the taxes they paid every year and hated the industrial sewage pollution they dumped every year. Pittsburgh's current lifestyle has finally become a liveable city after decades of governance. But as long as these steel companies are around, they have to invest a lot of money to treat industrial wastewater every year. Now the Pittsburgh government and all the people are finally going to usher in a "savior." Not only industrial wastewater can be solved once and for all, but also the problem of heavy metal pollution left by the river in history can be solved. The two accompanying engineers from Amano Heavy Industry asked the workers to install the wastewater treatment system in the huge wastewater treatment tank and connect the waste pipeline. When the trial operation began, the citizens of Pittsburgh cheered, especially when the infinite source and pollutants like sludge were released through the drains. Every citizen who watched the news constantly praised it. "Audience, have you noticed those magical purple lights in the water?" A reporter from the local Pittsburgh TV station enthusiastically pointed to the sewage treatment pond, her tone rippled violently like a raging chest: "These magical purple lights will attract all harmful substances, and I can't describe my mood right now is like seeing magical magic. ~ Since the 1950s we started to suffer from water pollution in the Pittsburgh area. Now we finally have the ability to say no to any water pollution! "In Pittsburgh, Lake Ontario, and Phoenix, in these three pilot areas, all the equipment is now installed. As soon as people saw this sewage treatment system, they all praised it. This type of equipment is the one with the highest technological content and the simplest installation and operation that they have ever seen. They just need to prepare a large sewage pond and place the equipment in the middle of the sewage pond, and in two and a half hours, a sewage pond can be purified into light-colored sewage that meets industrial wastewater discharge standards. The sewage treatment equipment on Lake Ontario will purify the disgusting lake boats of black silt. Watching the Lake Ontario video that was posted on the internet, no one could imagine there were nearly endless pollutants in the seemingly clean lake, and its playback had a success rate of over 5 million that day. As for this equipment, it was never able to purify the water source in the quality of clear and transparent water as had done the product of Monster Heavy Industry; but still, the public was indulgent with the result. After all, this is only a test product, and the quality will definitely improve in the future. However, with the growing popularity of video and news, the towns that have not installed a sewage treatment system and the residents of the other four lakes are unhappy. Why? Why these three places can benefit from this period product, but they cannot benefit from this blessing? So they protested and complained online because the sewage treatment system has become a living topic. A lucky few in several regions have shown their superiority and hatred, and netizens from other cities have expressed their displeasure in various

comments. Suddenly there was sporadic news that spread over the internet about the death of a group of fish at the bottom of Lake Ontario and was dumped at the lake's edge.

### **Chapter 616: New energy vehicle.**

To date, Ye Qing has built a total of 1,000 plasma batteries. The batteries of Watcher III and Watcher X have been replaced by a plasma energy battery and can now run worry-free for a day. At the same time, Ye Qing also embarked on research into products derived from plasma batteries. Ye Qing thought of the Magic Cristal mobile phone, simply selling it with the dream screen or integrating the plasma battery into it, what is the best choice to create more economic value? But Ye Qing now faces a problem, industrial materials for making plasma batteries are not enough..... Just as carbon can be converted into diamonds, plasma battery converters also have this magical technological ability to change the properties of materials. But unlike the element carbon that can be seen everywhere, the materials to be converted into plasma batteries must be made up of a variety of metals and compounds, including several rare metals. Among them, the metal Dysprosium which is the rarest. The other metals are fine, they are a little more expensive, but the supply on the market is still sufficient. However, Dysprosium metal belongs to the rare metal which has so much market share, and there is no way to buy a large quantity. Maybe most people have never heard of this name. It is ranked # 66 on the periodic table and there is only one description in the periodic table, which is "hard to get". Dysprosium is a silvery-white metal, soft in texture and conductive when close to absolute zero. Before the electronic revolution, the Dy was basically useless. But with the increasing advancement of science and technology, more and more uses of Dysprosium have been opened up. It can be used to make permanent magnet objects, to make new light source luminous bodies, to add to nuclear reactors to play a controlling role, and it can also be used as a catalyst, and so on. Now it has one more function, as one of the main materials of plasma batteries. The market price of Metal Dysprosium is 1600 dollars per kilogram, and a standard plasma battery requires one kilogram of metal dysprosium..... Previously, the Monster Heavy Industry Company searched for a ton of Dysprosium metal, which increased its price by 20%. Now to place a new order again. China Rare Metal Market said that if it is a jackpot, there will be a shortage of Dysprosium metal because other factories demand it, and they will be unable to get enough Dysprosium for its supply for the production and processing of the plasma battery..... It is not a question of money. Most of the Dysprosium Metal was in Monazite, and there is so much production capacity, and the Monster Heavy Industry suddenly needed a large amount of Dysprosium Metal, which couldn't be available in a short period of time..... Of course, Ye Qing could also reduce the proportion of metallic Dysprosium to produce a shrunken version of the plasma battery. Dysprosium metal plays a catalytic and active role in it, and the minimum demand is 1% and the best demand is 10%. Monazite minerals are the most energy store in China, and Monster Heavy Industry has asked the Ministry of Geology and Mineral Resources to see if it can increase the refining capacity of the Dysprosium metal. However, the problem cannot be fixed in a short period of time. So, Ye Qing made the decision to research plasma battery derivative products first. The energy density in a plasma battery at this time is eight times that of a lithium battery with mature technology. So what can it be used for? Ye Qing was certain to apply it to the mobile phone Magic Cristal, but he should wait for the launch of the next generation. And it will also be incidental. The cell phone battery size is too small. It is enough to improve the competitiveness of the mobile phone Magic Cristal. If he wanted to make a lot of money, he would need to find a plasma battery that could take up a smaller volume..... Now, Ye Qing wants to orient its products towards the new energy vehicles which are very popular today! He thought about how a sedan could be fitted with eight full-size plasma

batteries and a scaled-down version that had to be fitted with four plasma batteries. It's a goal that excited Ye Qing when he thought of it; China is the world's largest automobile market. However, almost all mid-to-high-end models over 150,000 Yuan are controlled by foreign-invested enterprises. Volkswagen, Toyota, Honda, Hyundai, Audi, BMW, Mercedes-Benz, which one is unfamous? And they dominate the incredible Chinese car sales market. In the early years, domestically produced family cars were difficult to survive. In recent years, nationally made independent brands have made their fortunes in low-end models, but the auto market with over 150,000 Yuan is still completely lost. If a mid-range car is launched and these foreign brands are gradually sold, how exciting will it be? He was not sure about this project before, but after the release of the plasma battery, Ye Qing was quite sure. With the addition of the black sixth stage electromagnetic motor technology, Monster Heavy Industries will have no problem occupying the entire middle and high-end automobile market from over 200,000 Yuan to less than 500,000 Yuan. When the reputation of the car is well established, the launch of a luxury car worth more than one million Yuan will surely cause all foreign automobile brands to spew 30,000 liters of blood. The technology is available, and the qualification to produce station wagons is also applied, but Ye Qing still lacked the styling technology and the interior design of the car. "Boss, what do you think of that appearance?" In the secret lab under the Monster Industrial Building, Tianjin spent half an hour sketching a report of a sedan based on its own aesthetic. It was a cool sedan with avant-garde styling. The front air intakes are removed, only the air-cooled air intakes are kept on both sides, and the front spoiler, side skirts, and rear diffuser are installed. The front logo was naturally a majestic and mysterious metallic monster, four-wheel drive, and a panoramic sunroof. In the review, a suspension design was also used to integrate the windows on both sides of the car with the three-door pillars, which were full of science fiction. "The shape is OK, do it first and take a look." Ye Qing, who was setting up the power layout, nodded slightly. Tianjin quickly marked the size parameters, and in less than half an hour, the Master Metal Experts there used a fast 3D printer to print a composite plastic car shell of the same size. The computer automatically mixed and sprayed the paint, and when the painting was finished, the Master Metal Expert lifted it into the open space in front of Ye Qing. Five other models of car hulls with different shapes were also placed there. There was also an SUV hull model. He looked like a badass with thick edges and corners, and a height of almost half a yard. When people watch it, they'll associate it with the majestic monster on the Monster Heavy Industry icon. "What about the design of the adjustable color glass, boss?" After finishing the rendering of the appearance, Tianjin looked into the details of the car: "This is the kind of technology that can automatically change the color of all glasses, including the front windshield." "I found out on the Internet that when Chinese citizens buy a car, 99% of them will go to the auto beauty salon and put a film of colored glass on the glass." This question made Ye Qing a little embarrassed and coughed twice, because from the first Wuling Light to the current Lagonda and Mercedes-Benz, Ye Qing has put a film on the window. "Cool design. We human stick the film, the purpose is to block the glare of the sun, reduce the temperature in the car in summer, but also play a protective role. But at night, the colored glass film becomes a burden; it will reduce the brightness of the outdoor scene. This makes people unable to see the road conditions. " "Color-changing glass can be included as one of the must-have technologies, and all models should be equipped. It also requires a variety of color changes, filtering ultraviolet rays and filtering the brightness of road lights. " "And automatic driving?" Tianjin shook his head triumphantly: "Before, my teacher and I studied image recognition technology in depth. The observer playing LOL relies on image recognition to function. If this technology is applied to driving. autonomous, it will undoubtedly crush all the technology of the autopilot." Speaking of which, Tianjin showed he has made rapid progress in electronic information

technology, and Ye Qing also wanted to thank him for his selfless teaching. "Yes Yes!" Tianjin's ears pricked up even higher: "Well, you can study it." "But I'm good at it." Ye Qing smiled triumphantly: "I asked the purchasing department to order a batch of luxury cars, including Bentley, Rolls Royce, Lamborghini, and Ferrari. The goods will arrive in a few days. Then we will study the automotive technology of the point therein."

### **Chapter 617: Please note there is an abyss ahead.**

Amano Heavy Industry had finally achieved its goal. On that day, it became more and more skilled in the production of the sewage treatment systems, and the share price also continued to slowly rise. It looks like the momentum is never going to stop. And well-informed shareholders never doubted what earnings they'll get, and as soon as someone offered stocks on the market, they were desperately rushing to buy them. But... Amano Heavy Industry's shares appeared to have been favored by a mysterious investment crocodile.

As soon as the positive news from Amano Heavy Industry came out, investors found Amano Heavy Industry shares to be extremely difficult to buy. Because there were always people who persisted in placing orders for two Yuan more than the current share price on the trading platform to absorb the shares. These crocodile buyers have offered to buy the equivalent of a thousand shares, and once the harvest is over, a price is immediately listed above the current share price, but the flow never seems to want to stop.

Some shareholders and small investors also got involved in this game and had to raise prices to get a share of this mysterious predator.

After all, everyone was confident in the share price of Amano Heavy Industry. According to them, since the US government was responsible for the sales of their products. This share with a current price of 73 has no problem crossing the 100 mark.

Who is this cruel predator? BlackRock Fund or Schroder Fund, or Baida, or one of the major national private equity firms!?

Even the media have speculated on the track record of this predator, because according to statistics, with this order acquisition mode of operation, it has already absorbed 5 billion shares. According to its appearance, retail speculators cannot snatch any share. The shareholders were crazy, the technicians and engineers of Amano Heavy Industry were crazy, and even Zhang Yutian went crazy.

All three sets of wastewater treatment systems have gained a high reputation in the United States. Zhang Yutian frantically called out all competent technicians and engineers to produce products around the clock.

.....

Even the engineer in charge of controlling smart gym products, the manager immediately asked him to leave his post and led him to join the production of wastewater treatment equipment. He personally told him: "What's in a smart gym? ~ A set of wastewater treatment equipment was sold for 200 million euros. ~ Isn't the automatic assembly line the core business of the company? ~"

~ In the future, new orders for the smart gym product will not be accepted and old orders can be changed hands, so quickly switch hands for other activities. This smart gym production line, with thousands of people, only earned two to three billion in a month. Bring these talents to build sewage treatment equipment and earn them in two days. Even the parent company, Anqi Heavy Industry, has announced it will now provide full technical and financial support to Amano Heavy Industry.”

[In the past it was not enough to brag about sordidness, but now debauchery is limitless.]

Faced with incredible success, Zhang Yutian’s days are like star Wen Changxing on Earth, and apart from him and Ye Qing, not all startups in the industry are well run. Who else can double the size of the company in just one month and achieve a \$ 50 billion increase in total assets?

Behind the huge improvement in assets is Zhang Yutian’s incredible equipment investor. He signed huge equipment purchase agreements with many large foreign industrial enterprises in one fell swoop, asking them to create more advanced supporting production equipment for the wastewater treatment system as soon as possible. . In addition, he also ordered a G750 from Gulfstream Airlines. In order to get the plane as quickly as possible, Zhang Yutian did not hesitate to increase the price by 20%.

That’s right; he wants to compare himself with Ye Qing. What Ye Qing could do, Zhang Yutian can do the same.

.....

The United States was also on the verge of anger with madness.

Amano Heavy Industry has continuously supplied eight wastewater treatment systems in the United States, but they are still insufficient in number. Director Lancelot urged him several times a day to make every effort to produce alternative wastewater treatment systems.

This kind of equipment is so easy to operate, and even the sewage treatment plant does not need to be modified, it can be used directly by placing it in the sewage treatment tank.

Director Lancelot also didn’t want to urge Amano Heavy Industry every day, but now lawmakers in 50 states across the United States have almost had a fight in Congress over having these sewage treatment systems move into their own states.

Even the state of Maine, with only a population of over a million and such a backward economy and few industrial factories, has plausibly cited a range of reasons for struggling to have this. sewage treatment system.

Look at these reasons. The quality of groundwater is too high in sulfur and citizens have bad opinions about the quality of tap water. It is clear this water comes from water sources rich in minerals in large quantities.

According to the assessment by the Environmental Protection Agency, the United States needs at least 500 sets of wastewater treatment systems to barely treat all industrial wastewater, and with this production rate the state Maine will have to wait three to five years to receive its water purification system, which has caused states in the United States to be worried, and European countries to be even more worried.

The history and culture of Europe and the United States are similar. People in European countries can only look at the American side happily solving the problem of pollution of its industrial wastewater. Amano Heavy Industry kills them indirectly; moreover, it regretted having signed a strategic contract with the United States.

Of the eight wastewater treatment systems shipped to the United States, the greatest change occurred on Lake Ontario.

Ever since a ship carrying the sewage treatment system arrived in Ontario, which was polluted with heavy metals, and set sail in it, residents of several nearby towns have come in groups of three or five. They were driving motor homes or vans dragging small yachts behind them, and when they got to the lake they put their small yachts in the lake and followed the ship carrying the sewage treatment system like tadpoles, shouting exclamation marks and constantly looking at the magical equipment that extracts pollution from ships and the polluted lake.

The color of the pollutants was the same as the color of the belly of the fish living in this lake, which was dark black.

The water passed by the sewage treatment vessel had evidently changed from dark blue to clear transparent water. Although the purification period lasted only a short time, the image of Lake Ontario has changed and the people here have the impression that they have changed lakes and discovered another lake, the citizens mid-Seers and half-observed in their yachts had already recorded this change on video and uploaded it to their Facebook space and Youtube video.

Today, on a Youtube video, someone uploaded a five-minute video shot in Lake Ontario in the evening. In just two hours, it exceeded 500,000 views.

The shooter in the video was called [Shining Hebrew], and in his personal details, he introduced himself as an environmental worker. In the first half-minute of the video's start, it was his selfie introduction as well. It was introduced that he is originally from Seattle and had many years of experience in water resources and biological protection. He was obligated to help the local government to more scientifically control heavy metal pollution inside Lake Ontario.

This time he came to Lake Ontario, he had not only brought professional diving equipment, but also he was going to take samples to analyze the water quality.

In just half a minute of self-introduction, he had revealed his big heart for caring for the environment, and when he had boarded his investigative vessel and followed in the ship's footsteps treatment of sewage from the tributary of the Ems River to Lake Ontario, the environmental worker couldn't help but scream in shock from the bow of the ship.

"Oh my God ~ Two years ago when I came here, the color of this tributary was still dark blue, and most of the suspended matter in the water was heavy metals. Now the quality of the water here is the same as that of spring water, and it is so clear. ~ It is the power of technology. ~ Friends, this is a revolution in our environmental protection business! ~ A little cruise in a speedboat on a tributary ten meters by meters, where the trees on both sides of the bank are hatched, the submarine sand ripples, and the aquatic grass swaying. ~ This is a paradise for fish life! ~ Wait ~ I can't see a fish. I remembered two years ago there were fish everywhere, even though their bellies were black... "

The doubting environmental worker wondered, and under the dynamics of the live messages, the audience also wondered why he couldn't see a fish.

When the speedboat made a turn and sailed down the main river in the forest, this environmental worker saw a scene he will never forget. On the main river Ems, tens of meters wide, there was an endless thick white substance insight. On closer inspection, these white substances are all fishes, densely spinning their bellies on the surface of the river.

All fish; whether it is a red-bellied, palm-sized pomfret, or a carp half a meter long, a fierce finless eel with a body length of over two meters, the whole floated quietly on the river. The river below could be unblown by the strong wind, and there was no sound of animals on either side of the bank. It had become a death scene at the end of the day.

The outboard motor roared and the environmental protection worker screamed in horror. Everyone who watched this video had uncontrollable fear in their hearts. Why has the water quality obviously improved, but the fish here ushered in the doomsday disaster?

.....

Zhang Yutian got up from bed sweating profusely when he received an emergency call from Lancelot, the head of the Environmental Protection Bureau because the company employee urgently informed him from that scene on the world's largest video network, Youtube, five minutes ago.

"Mr. Lancelot, listen to my explanation. This issue could be related to the change in water quality. The fish suddenly changed from water polluted with heavy metals that have been used for decades to purify and cleanse water. Maybe because of the changes in the environment, there was a situation where they couldn't adapt, and they are dying on a large scale."

As soon as the call was connected, Zhang Yutian quickly explained without admitting responsibility.

"I called, not because of the fish death incident in Lake Ontario," Lancelot's tone was very serious.

"Ah? ~ This is... What is it..." Zhang Yutian's back was drenched in a cold sweat.

"You have to come right away, come to the United States and accept our technical investigation," Lancelot's tone grew colder and colder: "Half an hour ago, the sixth treatment plant that you sent was in Montana. In Helena, a very serious industrial accident occurred. ~ At this very moment, Mr. Governor of Montana, who went to the sewage plant with dozens of members of Congress to visit your equipment. ~ The purification equipment suddenly shorted out, a purple light. The governor and dozens of members of Congress fell into a coma on the spot. Now, they are in the intensive-care unit."

### **Chapter 618: The world turned purple.**

Headmaster Lancelot's tone was colder than that of an iceberg, making Zhang Yutian feel like he was falling into an ice cave, cooling instantly from the soles of his feet to the top of his head. Mr. the governor and dozens of members of Congress were admitted to the intensive-care unit. How is that possible because of his sewage purifier? Although the testing time of the sewage treatment system was tight, Zhang Yutian could guarantee his test method was absolutely scientific and the product could have technical failures, but it was unreasonable that it could release strong ionization that hurt people." Mr. Lancelot, is that... Is there a misunderstanding? First of all, there were engineers from the United States

who were present from the start of the technical research," Zhang Yutian quickly put aside his responsibility: "It was probably something went wrong, for example, improper use of the sewage treatment plant. ~ Our treatment plant has no problem." "It is too early to say anything. The governor and dozens of members of Congress are in a coma. No one can suppress this matter. Now the President has taken it upon himself to personally investigate this matter." "In this side, you don't stand a chance." Lancelot ordered: "Twenty-four hours later, I'll see the tech team led by you in Washington." "Yes Yes... .." Zhang Yutian's heart was already filled with fear, and for some reason, the YouTube video that all aquatic life in the river was extinct was heavily removed. Of course, in the internet age, the angry opinions of internet users cannot be blocked by blocking. This seemingly apocalyptic scene, the endless corpses of aquatic creatures, deeply angered the American people. As we all know, people in Western and European countries have a lot of sympathies. It is said that whether they are full and have nothing to do or have a high level of mental awareness, they cannot see those kinds of large-scale animal deaths that are close to slaughter. Originally, they were still on the video and were discussing this issue quite rationally. After a few hours, the video was suddenly blocked. Someone recorded the video and rehearsed it, and as a result, even the account was blocked. This time, netizens who were able to hold a memorial service for a group of stranded dead dolphins sympathetically detonated their nests. Inside their comments, some wrote: "Why are these fish dying in large areas? Is it related to this kind of wastewater treatment system? " "I thought to myself how nice it is to have such miraculous technology, but lo and behold, it just so happens that it has some major flaws that will cause the death of all aquatic life." "If we want to use the cost of living in the water in exchange for the quality of clean water then we would rather not have this technology, if the government does not provide a reasonable explanation then we will protest collectively." In the face of violent anger on the Internet, of course, the Environmental Protection Agency dared not act negligently. It didn't take long for it to give an explanation. The announcement stated the video was banned on demand of the Minister of the Environment because before the conclusion was reached, the video could easily become the material for foreign hostile forces to smear the image of the United States. In fact, long before the video went live, the environmental protection department had already discovered a large-scale death of fish. According to the findings of the emergency team, the vast area of fish kills was due to heavy metal pollution of Lake Ontario that had existed for more than 50 years. After decades of reproduction, the fish living here have adapted their bodies to heavy metal pollution in the water. Now that the water quality has become clear, the fish have experienced a fatal survival crisis due to the sudden change in their living environment. At the same time, the official website of the Environmental Protection Agency had also listed many examples of fish with demanding water quality. At the same time, the Lake Ontario wastewater treatment plan is temporarily on hold and will be unimplemented until a plan is developed that does not harm aquatic life. This explanation convinced most people, after all, they had guessed in this regard before. Those who knew the habits of fish wondered why all fish die. Even the catfish, which have a particularly low water quality requirement, could not escape the bad luck, and it took time to escape from the still polluted Lake Ontario tributary. But they're a minority after all and don't have a heavy media voice, allowing the Environmental Protection Agency to fabricate even more reasons..... Early in the morning, Zhang Yutian drove several technicians to the United States. Sitting in the first-class cabin, his expression was a little dark and terrifying. What's the concept of a governor and dozens of congressmen living in an intensive-care unit?..... There are fifty states in the United States, and the power of governors is greater than that of a province in China. Because the United States is a federal system, each state enjoys a high degree of autonomy, with the exception of diplomatic and military

rights. They can discuss state laws themselves and have their own parliament.....The sewage system has even sent a governor and dozens of congressmen to an intensive-care unit, tantamount to confusing the minds of a state. On this trip to the United States, Zhang Yutian understood that even if he didn't die, he would have to tear his skin off.The trip must be made to the United States because the market share of the sewage treatment system in the United States is estimated at 150 billion Yuan. Even if Zhang Yutian does not go, his shareholders will force him to go to the United States to allay the anger in the United States.As to why this happened, Zhang Yutian had also analyzed it internally.....The central component of the wastewater treatment system is a powerful ionization generator. When it works, electronic products will be affected and shorted in the radiation range.But since humans are poor conductors of electricity, with voltages below 38 volts, normal people will not feel it when they are touched by this intensity, and will not damage their bodies. But the voltage of 38 volts can short circuit a lot of electronic products, be aware that the battery of a cell phone is only 3.6 volts. Therefore, in the strong ionization position, electronic products will be short-circuited, and people will not feel abnormal. If the strong ionization position is short-circuited by itself, and an electromagnetic storm that can resist the distant human body is released instantly, then the person will be like an electronic product, and his nerves will be burnt and damaged.It is not difficult to prove this point. As they dismantle the cell phones worn by the governor and members of Congress and check for damage to the internal circuitry, they will determine the electromagnetic force they experienced at that time. If the electromagnetic force is far from the safety standard, it proves that their products pose huge safety risks.....No words on the way, no phone calls on the plane. When the plane landed at Washington Airport, Zhang Yutian, who couldn't sleep the entire trip, got off the plane and saw two black Chevrolet all-terrain vehicles parked outside the track. This kind of black all-terrain vehicle appears in movies a lot, but every time it does appear it's either the FBI or the villain masquerading as the FBI.The car door opened, revealing Director Lancelot sitting inside with an icy face, and before he was "invited" into the car, two tall, strong white men surrounded him, and a male white with a strong physique told him, "Please get in the car," and Zhang Yutian quickly declared his position."Mr. Secretary, whoever is responsible and whatever the results of the investigation, I am ready to represent Amano Heavy Industry to compensate the governor and members of Congress who suffered the same disaster for their enormous medical and medical losses massive mental health.""Mental loss?"Director Lancelot suddenly sneered, "You know, during the fourteen hours of your international flight, what happened again?" "What... what, what... what else?" Zhang Yutian's face started to turn pale."The governor and members of Congress have been medically assessed as vegetative. ~ You can save a tremendous amount of mental damage," As soon as Director Lancelot finished speaking, the two white men in suits held Zhang's men. Yutian one by one, and was thrown straight into the Chevrolet all-terrain vehicle, and manager Lancelot said coldly sideways, "Now your only chance is to find this fatal technical flaw immediately. When the fault is found, we will stick a huge ticket on you, and arrest several technicians, in addition, the cooperation between us will still be discussed.""And if I can't find it..." "Hmm!" "I want three days," Zhang Yutian said with a dead face."Yes," Director Lancelot nodded: "Now all of the sewage treatment systems are shut down, and it turns out, there is one in the Washington sewage plant. During those three days, you and the technical team will be supervised until you know the technical faults."Zhang Yutian nodded and sank into the seat unable to say a word.In silence, the two Chevrolet all-terrain vehicles quickly drove to the sewage treatment plant at the southern tip of Washington.There was no reception, and when they got out of the car, they were directly "invited" to a warehouse.The wastewater treatment system, which represents Amano Heavy Industry's most advanced technology, was placed in the middle of the warehouse. Zhang Yutian raced

against the clock and immediately gathered a few technicians to retrieve tools from the randomly carried luggage."If you need anything you can let me know," said the strong white man in charge of the guard.Zhang Yutian nodded, then had branch technicians sign the power supply sewage treatment system.At that time, on the link, Zhang Yutian suddenly heard thunder, then felt that the whole world was gone."What... what's going on?"Zhang Yutian, who was far from the sewage treatment system, felt his vision suddenly turn purple and fell heavily to the ground. It didn't hurt at all, it was the last thought on his mind, then darkness engulfed everything.

### **Chapter 619: When you wake up, heaven and earth change!**

The world was dark.

Zhang Yutian did not know how much time had passed when his thoughts returned to his body and he was able to perceive the mysterious sounds outside. He struggled to open his eyes. The first thing that came to his eyes was the snow-white ceiling, and his thinking was still chaotic. He could only hear someone screaming, the screams that came to him seemed to be in English.

"Wake up!"

"Well, he was finally saved!"

After Zhang Yutian struggled to get rid of the dizziness in his mind so that he could clearly see his surroundings. He found he was resting in a room filled with various instruments. There were several pipes connected to his hands, feet, and chest. It appeared to him that he was wearing a "helmet" over his mouth and nose, and there was a heart rate monitor next to him that chirped every now and then.

This is... Is this the intensive-care unit?

"Did you finally wake up?" A male doctor with a mask on his face walked excitedly at the bedside from one side of the bed to the other side of the bed: "First you don't move. I'm going to give you a general examination of the nervous system."

"I... am I a shrimp?" Zhang Yutian wanted to ask the doctor something, but the words came out of his mouth and turned into a voice he couldn't understand.

"At the beginning, don't speak. Your central nervous system has been injured. This is already the best result after waking you up," the doctor waved his hand in disapproval: "Come on, move your eyes first."

After a two-hour test, after the test of identifying illustrated cards of objects, movements of muscles and joints of the whole body, tasting of sweets and bitters, and the smell of all kinds of aromas. The attending physician enthusiastically announced that the patient had no problems except for impaired speech function.

Zhang Yutian looked at himself confusedly in the mirror. In the mirror, he had a bit of thatch, and his face was pale, his eyes were bloodshot, and the red matched the lantern.

However, his mouth was crooked, no matter how hard Zhang Yutian tried to readjust it; he couldn't make it like it was before. The doctor said that if the recovery is good, it is possible to recover all of his functions within a year or two. Of course, the recovery of language skills will be faster, provided he exercises more frequently.

The coma didn't last long, only thirty-five hours. That's just why he was like that.

What happened in the warehouse?

Zhang Yutian had no memory of it.

When he was "invited" to the Environmental Protection Agency by the two government officials, he realized what was going on.

The surveillance screen showed the technician had connected the power supply to the sewage treatment system and the triangular device stowed in the middle of the warehouse suddenly exploded with a spark, then a purple halo instantly swept through the warehouse. Then the picture stopped because the surveillance equipment was also damaged by the halo, the video could be seen because of the remote storage.

During the surveillance, Zhang Yutian stood far away, which is why he had the chance to regain consciousness. The other technicians were not so lucky, the doctor reluctantly informed Zhang Yutian that these technicians, like the previous governor, could never regain consciousness.

"Zhang Yutian, do you know what happened during the thirty-five hours that you were in a coma?" Director Lancelot's red eyes matched Zhang Yutian's: "If I step aside, you won't have a better life," the former threatened fiercely without waiting for Zhang Yutian to respond. The latter shook his head in confusion. Now he can only speak Mandarin vaguely. He can't spit out a sound in English.

.....

The external reaction was extremely strong, and the angry American people wanted to take Amano Heavy Industry alive.

The first things that go wrong are those of environmental enthusiasts. The sewage treatment system they were concerned about, without warning, stopped working and was locked in the warehouse.

At first, people thought it was linked to the large-scale death of fish in Lake Ontario. Later there was a slight gossip that the governor of Montana and dozens of members of Congress had a very tragic accident when they visited the sewage treatment system.

.....

Mr. Governor and many members of Congress will never wake up.

At first, everyone thought this gossip was too absurd and even made fun of people who spread rumors as having no IQs. While visiting the sewage treatment plant, is it possible that the governor and members of Congress collectively planted themselves in the sewage tank and bumped their heads collectively?

The first thing that was wrong was the Helena City Public Hospital. Almost all the news of the day came from here. It wasn't until someone filmed the governor and members of Congress lying in the intensive-care unit that people were shocked and realized the matter was serious.

The governor of a state and the politicians who keep the government running could no longer play for long and will disappear collectively. In addition, all the videos were exhibited, and there was to be a

statement from the government. So the government had to hold a press conference to announce this fact, and as soon as the news got out it shocked everyone!

An accident occurred in the wastewater treatment system produced by Amano Heavy Industry, which toppled a US governor and members of Congress. Even more frightening, the same accident happened when the president of Amano Heavy Industry rushed a group of technicians to find the cause.

Coupled with the mysterious death of fish in Lake Ontario, the American people immediately went from what they previously expected from industrial wastewater purifiers to some fear.

All TV news including all internet forums were bombed, and official government websites were filled with wastewater treatment topics. The people are crazy and want the government to explain and demand justice for the governor and members of Congress as well as for the innocent fish that fell victim to the disaster.

“This kind of equipment is like gamma rays, and it does a lot of harm to the human body. Is the Environmental Protection Agency going to bring this kind of equipment into the United States after eating shit?”

“The director of the environmental protection office must resign and be accountable to the people.”

“Amano Heavy Industries is a liar and a profiteer. We must punish them heavily.”

“Such enterprises which have no moral baseline for interests must be prohibited according to the law.”

For a while, everyone in Amano Heavy Industry, which was initially been popular, screamed.

And Zhang Yutian, at the time, who only had freedom of communication, was almost stunned and almost fell into a coma after a mad call. He was sitting in a chair, dazed with despair. Previously, his secretary had called him and told him that Amano Heavy Industry shares had managed to hit the minimum limit before the exchange closed.

Almost all of the engineers involved in the production of the sewage treatment system tendered their resignation. They preferred drafting the resignation process rather than waiting for their salaries to be paid to them.

Zhang Yutian could not speak clearly, but his head was intact. These engineers are eager to leave, naturally, they are afraid of being involved, because once the United States holds to hold them responsible and since they participated in the search for this product, they will be investigated, but as they are only small engineers, then what is certain, the management had to bear the responsibility.

The day after, the stock market opened, Amano Heavy Industry, without exception, fell to the limit instantly. As assets dwindled wildly, the American Emperor, the world hegemon, was about to raise a butcher's knife against Amano Heavy Industry angrily.

The president of the White House Oval Office was so angry that he directly destroyed the handmade sailboats the President of Colombia had recently donated.

“Liar!”

“Idiot!”

“Lancelot, didn’t you tell me Amano Heavy Industry’s wastewater treatment equipment has been tested and there is no problem?”

“Why, tell me why?”

Mr. President was like the angry lion who stared at the trembling Director of the Environmental Protection Agency, Mr. Lancelot, across the office with cold eyes.

“Tell me, how am I going explain this to our citizens?”

### **Chapter 620: For what does the husband refer to.**

Faced with the president’s harsh rebuke, Environmental Protection Agency director Lancelot was sweating and seemed unable to stand.”This... It’s not my fault. Zhang Yutian assured me that although the product testing time is very short, there are still some minor technical issues that are uncritical and that their engineers can solve them in the future, I think they did not expect this fatal fault, after all, even he along with several technicians were also affected by the purple wave.””I do not want to listen to these excuses. The cooperation plan with Amano Heavy Industry is facilitated by you. So the anger of the people must be appeased by you,” Mr. President knocked on the table: “Resign, I will compensate you by other means.”Lancelot suddenly froze, even though he also had this worst plan in his head for this problem. However, in his imagination, this should be the pattern that will only be discussed when public opinion cannot be persuaded and he will have to make such a decision when he has no other choice.And that was just a plan, and when it does, he will take the initiative to ask for his resignation and act as a martyr to the people. So, at that time, Mr. President will sing a red face, trying to keep it and so on.Reality is not a movie after all. The major faults caused by the company are unreasonably serious enough to be necessary. The director-general of a heavy national administrative unit has really resigned. But Mr. President’s actions are always so unexpected. Before the matter was serious enough, he ordered him to resign. It was then, Lancelot realized his political life was over, and what he was able to do was use his sacrifice to add “happiness” tokens to the rest of his life.....In the afternoon, Amano Heavy Industry sent a delegation of no less than 100 people to the United States to deal with the huge accident caused by the sewage treatment system.Zhang Yutian is now detained by the Environmental Protection Agency, and the Environmental Protection Agency has offered to release him on the condition that he signs a public statement stating that he is ready to accept the punishment without condition.The specific fines are to be determined by the accident investigation team, and the amount is not going to be small. Amano Heavy Industry must have been unlucky. It was his choice to cooperate with the United States. Now it had to go back and prepare a huge fine. Zhang Yutian must have gritted his teeth and signed this, which is a statement that can be taken as admitting to being shot by the United States.If he did not return to China, Amano Heavy Industry would lack a man at the helm and can therefore only go bankrupt. After his return, he may be able to turn the tide and, after paying a huge price, let Amano Heavy Industry rise from the ashes.As Zhang Yutian walked through the EPA gate, American reporters at the gate surrounded him in anger. The scene was a little out of control for a while, and the eyes of these reporters could have bitten him, and before the interview could begin, there were photographers and reporters who angrily accused him.”The executioner.””The unscrupulous capitalist.””You’ll pay the price.””Please stand aside, our chairman is not accepting an interview,” The two employees who escorted Zhang Yutian did their best to break through the crowd, but the reporters stood still like the wall of China.”Excuse me, when you Amano Heavy Industry were working on this product, did you realize this product was a huge safety hazard?””No... no, it’s an accident nobody wants

to have.” Zhang Yutian tilted his mouth. Answered in vague Chinese.....Since you cannot get out of the surrounding journalists, and then answer their questions. To take advantage of the situation.....Zhang Yutian chuckled in his heart, he managed to lure the Monster Heavy Industry into this vortex.”Accident? I’ve never heard of civilian equipment that can be more terrifying than biological and chemical weapons. Your attitude makes me feel a kind of indifference that ignores the value of life,” the Columbia TV reporter almost touched Zhang Yutian’s nose through the microphone.”If... it’s not an accident, do you think I’ll take my life to risk it??Whenever he thought about the scene from two days ago, Zhang Yutian felt his legs and feet were limp, “Please, believe me, when I go back to China, I will never sleep, and I will organize technical staff to find the cause of the problem and prevent similar tragedies from happening again.””Do you still want to keep launching this product?” Another reporter seemed to have heard the most incredible news in the world: “Permanent withdrawal from the market is your choice.”Zhang Yutian vaguely explained: “If we cannot find out the cause of the accident, we will definitely take this product off the market forever.””But in China, the wastewater treatment system produced by Monster Heavy Industry is increasingly used in industrial wastewater treatment.””As far as I know, Monster Heavy Industry refused to bring this product to the United States from the start. I don’t know the reason for a higher level. But I know the working principles of these two products are the same, so I also hope that through this accident the Monster Heavy Industry will be aware of the damage that the strong ionizing magnetic field can cause to the human body and to human beings organizations, and not to expand its production for profit and ignore the most important interests, especially those concerning the safety of persons.”As soon as the news got out, reporters were a little vigilant. Monster Heavy Industry’s original products are also based on the same principles as Amano Heavy Industry. Does this mean that similar accidents can occur in Monster Heavy Industry products?The citizens of the United States first discovered this product through the sewage treatment system owned by Monster Heavy Industry. Now, Zhang Yutian has announced Monster Heavy Industry has refused to bring its products to the United States from the start. It’s really easy to think about.Taking advantage of reporters’ astounding efforts to think about what he had just announced, Zhang Yutian and the escort slipped out of the crowd. He thought he had escaped the “devil’s clutches” of reporters, but after arriving at the airport, genius Zhang Yutian realized that a more serious crisis had just started. At the airport, a group of angry citizens who did not know where to find the wind had gathered.Zhang Yutian was obviously wearing a hat and a mask, but as soon as he entered the airport terminal, a black guy provoked and shouted: “This is the chairman of Amano Heavy Industry, let’s bring justice to the animals dead and our innocent compatriots!””Damn, how did they know the news?”Seeing dozens of nasty looks, Zhang Yutian immediately understood this premeditated confinement. Watching the black man rush forward and look excited, his first reaction was to turn around and run away. But before taking a few steps, he was suddenly grabbed by the collar from behind.”Police, police!” Amano Heavy Industry staff accompanying him shouted in panic, and the police who came after hearing the screams, and after clarifying the matter, or Zhang Yutian’s identity, unexpectedly got all over the place and just kept away and tried to persuade people verbally.....When Zhang Yutian with a bruised nose and swollen eyes returned to Asashima City, where he had been away for a few days, the Amano Heavy Industry had changed. The original active factory was shut down and engineers responsible for the production of sewage treatment equipment fled. Even employees of the company’s building resign from time to time.However, this is only the beginning. Amano Heavy Industry’s share price suffered a severe setback for three consecutive days. Compared to the stock which was close to 80 Yuan, it fell more than 40 Yuan.Sitting in the office, Zhang Yutian watched the course of the action fall off a cliff, wishing to open

the window and jump from the 20th floor."Old... Boss, bad news," his secretary rushed into the office in a panic: "The US Environmental Protection Agency issued... a fine."
