# GETTING A TECHNOLOGY SYSTEM IN MODERN DAY

**Chapter 13 Waking Up**

Although the Golden liquid wasn't active it was slowly strengthening every part it was passing through, that meant that he was being strengthened every part of the body as when the golden vessels where being made, they just run parallel to all blood vessels

The first changes were being done to the brain, as first golden liquid stream started arriving to it.

This was followed by every organ, as for every round the liquid does around the body the changes were being made. Although the changes were miniscule they will be accumulating overtime until his body is strong enough to be able to handle it when it is time to activate the golden liquid.

but that is all for later.

.....

Morning

When Aron woke up, it was already morning. This meant that he was asleep for more than 15 hours. He didn't feel the heaviness he should be feeling if you sleep for a long time. Contrary to it he was feeling stuffed like, either he goes to take a shit or he will explode kind of stuffed.

So he immediately jumped from the bed and hurried to the toilet like his life was depending on it, because to the current him it really depended on it.

when he arrived and sat on the toilet seat he let it go Elsa style.

...

'What the fuck was that?' thought Aron as he was opening the window of the toilet to let the shitty smell out, as the automatic air filter wasn't doing it fast enough.

This all started after he ran to the toilet to settle the number two, but what came from there wasn't what was expected at all. What came out from there was dark goo that smelt like sewage.

Also he couldn't believe the amount of it that came from his body, but all he knew was that something must have happened to him while he was a sleep. but damn that shit was smelly HOLY SHIT!!.

thank god everyone was a sleep else they might have wondered what was going on there.

.....

After he finished removing the goo from his body, he finally felt peace.

Inner peace master Oogway style came to him.

He said "Status" in order to find out what was the reason he needed to shit that goo thingy because he was sure that the system was responsible for it.

[STATUS]

Name: Aron Michael

Age: 22

Height: 1,89m

System Class: Runemaster

[!!New][Runic heart]

[SHOP]

[20,600sp]

[QUEST]

When he saw the new tag next to the Runic Heart he knew it was it, so clicked it immediately.

After the he clicked it a new screen appeared in front of him.

pɑndɑ,novɐ1,coM [

[Runic heart]

[Status: INACTIVE]

A Special heart for Runemasters, It allows them to use all of runes in existence if you have the knowledge of it.

Further information to be provided after it goes into active status.

]

Although the starvation of details wasn't doing him any good, he knew that even if he was told more it wasn't that helpful because the heart was inactive state.

.....

After riding the toilet of its smell he decided to clean his body to as he didn't know what came out of it while he was asleep.

Then he left the toilet to go and begin his daily quest.

As he was running he felt like he was flying because he was almost half way of his 15km run but he wasn't even out of his breath, usually he needed to rest for few minutes before he completed the rest of it, but today he continued until he finished without even resting and he wasn't that tired.

So, he decided to continue and complete the rest of exercises before he returned home and went to prepare himself some food as he was feeling hungry and he hasn't eaten since yesterday.

....

After cleaning himself again and eating to his full, he finally was ready to return to his office and continue with his plan.

He sat in front of his computer as he was checking the knowledge of Prometheus++ programing language in his head.

The moment he thought about it a large amount of knowledge was brought ahead with every detail on how to use it and how to build it. This meant that the moment he completed the making of the language he will also be the most knowledgeable about it as every detail about it was all in his head.

Aron took a deep breath, his eyes fixed on the blank screen in front of him. His head has already mapped out every detail of the new programming language - he knew exactly what it was supposed to do and how it was supposed to work. But now came the remaining part - actually bringing it to life in this universe at least.

He began typing, his fingers moving across the keyboard with a fluid grace that belied the complexity of the task at hand. Lines of code flowed onto the screen, each one building on the last as the structure of the language slowly took shape.

As he worked, Aron's mind was a blur of algorithms and data structures. He had to make sure that every aspect of the language was perfectly written as was needed, that every feature was written as it was in his mind.

Hour after hour, he typed tirelessly, his fingers flying across the keyboard as he wrote and wrote the code, checking it again and again until everything was just like it was.

Finally, after what felt like an eternity, Aron leaned back in his chair and gazed at the screen. There it was - the code that would bring the new programming language to the universe.

He pressed a button, and the code began to compile. Aron watched anxiously as the progress bar ticked slowly upward, his heart in his throat as he waited for the final result.

At last, the compiler finished its work, and Aron's programming language came to life. It was a moment of triumph, the culmination of two weeks of hard work and endless hours of dedication.

It was a moment of triumph, the culmination of weeks of hard work and dedication. Aron felt a deep sense of satisfaction, knowing that he had created something truly special (Although the system gave it to him, just let him relish the moment guys) - a language that would change the world of software development forever. That is if he releases it to the public. A downgraded version of it? Maybe, but never the full version, unless he has a better one.

As someone once said "Always stay ahead of others" (Sun tzu)

...

So, he decided to try it by rewriting BugZapper using this language which will make it faster and more efficient. As he was writing the code for it he suddenly stopped as an idea came to his head.

The idea was to make BugZapper a subscription program. So, that companies don't have to always wait for him to find and make them pay him million every time.

here is the plan,

First, there was the Basic plan. It was the free option and offered basic security and bug scanning for a single website once a month. It was just

enough to show the program's importance and usefulness but not enough to make them continue to use the free version.

The second plan was the Plus plan. It included advanced security features, the ability to scan up to five times a month and also giving the solutions. Which could be useful if your business or website is small.

The third plan was the Pro plan. It included everything in the Plus plan, but also offered daily website scanning and a faster response time from customer support. The daily scans are for added protection.

The fourth plan was the Elite plan. It included all the features of the Pro plan, but also added more frequent scans, vulnerability checks.

Finally, there was the Enterprise plan. This was the most comprehensive plan, offering all the features of the Elite plan, plus priority support and customizable reporting.

He will be downgrading the one that will be released for the subscription plan to not reveal those that haven't been discovered by anyone, but the moment they are discovered it will be reported as a new bug to al user of subscription. This will emphasize the importance of having ad maintaining the subscription.

Companies can have access to an upgraded version of the program that is on public by using the Enterprise plan, but this has to be negotiated with him or his company that he will create and its price will vary depending on the companies demand.

...

BugZapper Subscription Plan:

Stage 1: Free - Basic plan

-Access to a limited number of bug fixes

-Can report 5 bugs per month

-Community support available

-Limited customer support

Stage 2: Starter - $25/month

-Access to more bug fixes than the Free plan

-Can report 25 bugs per month

-Priority customer support

-Access to community support

Stage 3: Intermediate - $50/month

-Access to even more bug fixes

-Can report 50 bugs per month

-Priority customer support

-Access to community support

-Bug tracking and monitoring system available

-Ability to suggest features

Stage 4: Advanced - $75/month

-Access to all bug fixes

-Can report unlimited bugs per month

-Dedicated customer support

-Access to community support

-Bug tracking and monitoring system available

-Ability to suggest features

-Early access to new features and updates

Stage 5: Enterprise - Custom pricing (Starts at $1000 but increases based on their needs)

-Customizable plan based on company needs

-Dedicated customer support

-Access to community support

-Bug tracking and monitoring system available

-Ability to suggest features

-Early access to new features and updates

-Customizable bug reporting system

-Customizable analytics and reporting tools.
