

the Amazing Son In Law Chapter 6981

By [_](#) / August 16, 2024

Li Yalin's words caused Ai to fall into silence for a minute.

A minute later, it suddenly answered, "I have sorted out and studied all the books related to criminal psychology, as well as classic criminal cases from all over the world. From now on, in this incident, I will regard criminal psychology as an influencing factor, with an impact index of 50%."

Then, the AI said, "Based on the new ranking of influencing factors, the target company should be the one least likely to conceal production capacity and evade taxes among the seven companies. However, if it is based on this logic, then they have added thousands of additional people to consume electricity, and the unit power consumption on paper must have increased. In this way, KS Petroleum has become the most suspicious company. KS Petroleum is the most suspicious because of its high unit power consumption, and it is very likely that it is a misjudgment caused by concealing production. This is an unsolvable vicious circle that confirms and contradicts each other."

Li Yalin said: "If it only looks like an infinite loop, but not really an infinite loop, then there must be a key point to break the infinite loop that has not been captured. If it is indeed an infinite loop, it often means that we have found the right one, so the problem now is that you have to find a way to break your previous judgment. It's like you built a house. In order to ensure that its roof does not leak, you must first waterproof it to the extreme of your ability, and then try every possible way to pour water in from the roof. If it doesn't get in, it proves that your approach is correct. If it can get in, it proves that your approach is wrong."

A few seconds later, the AI replied, "I think if KS oil really has a problem, it would not leave a bug in its unit power consumption that can be easily discovered. It's just like what you said just now, when you make a big mistake, you should try to avoid making other small mistakes. So KS was discovered so easily by me, it is very likely that it did not make other big mistakes."

"However, the goal is to supply electricity to several thousand people, so I now have a guess that the other party should have other ways to obtain electricity."

After that, it continued: "All Skyline data related to Nigeria has been uploaded to the server. I need to combine Skyline data to identify the target in more detail. It currently takes about 90 seconds to enhance the image quality of all the images in the Skyline data to improve the resolution of satellite images. Please wait."

More than a minute later, Ai continued, "The image quality enhancement has been completed. I selected the data with the best image quality this year for analysis. All the identifiable high-voltage power supply networks around the seven oil fields belong to the

Nigerian Electricity Holding Company. The power consumption data I just obtained also came from this company, so it can be basically confirmed that there is no second power supply line in the seven oil fields;"

Li Yalin asked in return: "Based on your judgment based on satellite images, have you ever considered the possibility of high-voltage lines being buried underground?"

The AI replied: "I have checked Skyline's satellite images of the area over the past 15 years. The undergrounding of high-voltage lines is a large and time-consuming project, but no traces of construction that could be related to the undergrounding of high-voltage lines were found in the satellite images over the past 15 years."

Li Yalin was obviously a little surprised, because he found that AI had begun to prove its own conclusions before giving them, which was much more mature than giving the answer directly just now.

If you want to train an employee to make such a transformation, it may take several years. If the employee has a poor brain, he may never be able to make the transition in his lifetime. But for AI, it only takes a few conversations.

I think this is the importance of training AI. Letting a top detective train AI will inevitably make AI have very rigorous logic.

Li Yalin was obviously very pleased. He said with a somewhat excited tone: "You determined that the target's extra power consumption was not supplemented by the Nigerian Electricity Holding Company, and you also determined that the target should have no other external power supply channels. Based on this, have you come to any new conclusions?"

The AI model responded: "I think the goal should be to make up for this electricity gap by ourselves."

Li Yalin looked at charlie and asked him, "Mr. charlie, the Death Soldier Station can supply thousands of additional people with electricity. This gap should be huge, right?"

the Amazing Son In Law Chapter 6982

By [_](#) / August 16, 2024

charlie nodded and said, "The gap is very large, and the electricity consumption is not just as simple as the daily electricity consumption of these thousands of people. I have been to the copper mines in Cyprus, where thousands of people live in underground bunkers. The scale of the underground bunkers is very large. It has to carry all the daily necessities of thousands of people, even including the training of death squads. It is almost an underground city. Moreover, such a large bunker requires 24-hour ventilation and 24-hour drainage of groundwater. In order to confuse their judgment of time, the light there is as bright as daylight 24 hours a day;"

“In addition, the bases of the Qing-breaking Society’s death squads are not concentration camps, but homes where these death squads live and reproduce. Moreover, although the Qing-breaking Society uses special poisons and antidotes to control the death squads and uses their families as threats, in order to make the death squads want to live, they will provide them and their families with a relatively good living environment. Therefore, the temperature and humidity of the underground bunkers will be precisely controlled, and the power consumption will be very high.”

Li Yalin nodded and asked the AI: “How do you think the target can make up for such a large power gap by itself? Photovoltaic? Wind energy? Or other channels?”

The AI replied: “Based on the special situation of the target, I think oil-based power generation should be the best choice for the other party. Photovoltaic and wind power are too conspicuous and not stable enough. Coal-based power generation requires a lot of coal, which is easily exposed during transportation. Only oil can be directly obtained on the spot and is inexhaustible. Although the overall cost-effectiveness of oil-based power generation is extremely low, for any of the seven companies, it is insignificant to directly use a small portion of the mined oil for power generation.”

At this point, AI added: “Considering that you said before that concealing production is an unwise mistake, I want to clarify my point of view. Through the analysis of relevant cases of oil companies, I think that concealing production itself is not a problem. The real problem lies in how to deal with the concealed production;”

“The real risk of concealing production is to smuggle it out to gain greater profits. If the concealed production has never left the oil field or been traded, but is quietly converted into electricity and consumed internally, there is no way for the outside world to verify this behavior;”

“The relevant law enforcement agencies identify oil smuggling based on the fact that oil fields transport oil through abnormal channels in exchange for profits. However, for oil fields that produce tens of thousands or even hundreds of thousands of barrels a day, intercepting 0.5% of the daily production capacity before transporting it through pipelines is enough to make up for the power gap.”

“So, considering all the existing factors, I think this should be the best solution, which can not only make up for the power shortage, but also make all the apparent data look normal.”

Hearing this, Li Yalin couldn’t help but exclaim in praise: “It’s well-reasoned and convincing. So, if you were asked to determine the target based on your own judgment and the data from Skyline, could you determine the target?”

AI quickly replied: “After analyzing the data from Skyline, I think Kansel Petroleum is the most suspicious. There is a solid building covering an area of about 2,300 square

meters in the north-central part of their oil field. This building did not exist in the data from fifteen years ago, and construction began thirteen years ago.”

As it spoke, Ai displayed several pictures on the screen. The center of the first picture was still an open-air area with scattered vehicles and equipment parked. In the second picture, the foundation of the area had been laid and walls had been built. At the same time, a trench could be seen extending from the inside of the foundation to the nearest oil drilling rig.

Ai continued, “From the second picture, we can see that there is a pipeline project under construction. The oil pipeline connects to the nearest oil extraction machine. I guess it should be the oil pipeline. All the oil pipelines in the oil field are exposed, only this section of the oil pipeline is buried. It can be seen that the other party does not want this section of the pipeline to be exposed. Therefore, the inside of this building should be an oil generator set, and the largest volume among them should be a gas turbine.”

Li Yalin said: “If we simply rely on an oil pipeline to determine that there must be oil power generation equipment inside, it seems a little insufficient.”

Ai said: “I expected you to say that, so I also checked. The Nigerian Electricity Holdings Limited issued an announcement thirteen years ago. Due to the power shortage in Lagos and surrounding areas at that time, the company decided to implement power restrictions on companies in Lagos that were seriously wasting electricity. Among the companies on the list of companies with power restrictions was Kansail Petroleum;”

“The announcement said that the reason for the power cuts on Kaisail was that Kansail Petroleum had outdated equipment and its unit power consumption exceeded that of its peers. The announcement was released two months earlier than the start of construction of the building. According to my analysis, Kansail Petroleum had just been hit by power cuts and construction of the building started immediately. Since then, Kansail Petroleum has never suffered similar penalties again. Therefore, this building must be a small oil power plant!”

the Amazing Son In Law Chapter 6983

By [_](#) / August 16, 2024

According to the clues sorted out by Ai, it can be basically concluded that this oil company named Kansel was punished by the Nigerian Electricity Holdings Limited for power rationing due to its excessive power consumption more than ten years ago.

I think that it was probably because of the overall power shortage at the time that Kansale’s excessive power consumption caused some trouble for the Nigerian Electricity Holdings Limited.

After that time point, Kansel Oil immediately started to build this building whose purpose was not apparent, and secretly connected an oil pipeline to the building. After that,

Kansel Oil's unit power consumption returned to the normal level of the industry. So considering all these factors, Ai's analysis is indeed tenable. This building should be a small oil power plant. It is called a power plant, but in fact there may be several gas turbines inside. After all, Kansel Oil's electricity gap is not that large, and it is enough as long as the power supply of the underground bunker can be self-sufficient.

Li Yalin was very satisfied with Ai's performance. He said to everyone: "Being able to find so much useful information in such a short time is like solving a case. The police and FBI in the United States are ready to serve you at any time. The response speed is beyond ordinary."

charlie couldn't help but sigh: "If Inspector Li can train it well, there should be a lot of room for improvement."

Li Yalin said: "Training is one thing, and providing more data is another. Skyline's satellite data over the years has been a great help. Otherwise, it would be difficult to locate the Cansail oil."

Li Yalin added, "In fact, before Ai locked onto Cansel, I personally always thought that the most likely candidate should be another Rafael Petroleum, because the capital structure and shareholder information behind these seven oil fields show that there are four companies controlled by European and American capital, only one local Nigerian company, and two controlled by Asian capital. The actual controller of Rafael is Jerry Zhang, a Chinese of South African nationality. Although the Broken Clearance Association has a global layout, it is mostly Chinese after all, and Rafael's accident rate over the years is the lowest among the seven companies. I think the Broken Clearance Association will definitely reduce the occurrence of accidents as much as possible in order to avoid trouble, evade supervision and inspection. In addition, many of the staff should be relatives of the dead, so even if an accident occurs, it can be easily suppressed;"

"However, these inferences of mine are relatively subjective and lack objective evidence to support them;"

"Enterprises controlled by Chinese are not necessarily bankrupt. After all, Chinese investment in Africa has been increasing in recent years;"

"The low accident rate is also a feature of overseas Chinese-controlled enterprises. Especially in Africa, the accident rate of Chinese-controlled enterprises has always been far lower than the local average.

the Amazing Son In Law Chapter 6984

charlie nodded and said, "The organizational structure of the Poqing Society is very similar to the Ming and Qing officialdom. The three elders are people around Wu

Feiyan. Even if they are not from the Wu family, their status must be very high. The Grand Commander of the Right Army Governor's Office, even if he is from the Wu family, is only a frontier official. When the three elders come to his territory, he must show enough respect and will definitely come to entertain them in person. At this moment, maybe he is in the Kansel Oilfield like the three elders."

As he said this, Charlie not only jokingly sighed: "It's a pity that I am not strong enough, otherwise I can kill the three elders and the Grand Commander of the Right Army Commander's Office together, which will definitely be a huge blow to the Poqing Society."

Li Yalin said: "Mr. Charlie, the three elders are too powerful, you should not take the risk, but if there is a chance to lock on to the Grand Commander, it will be much more feasible to find a chance to kill him."

Charlie nodded thoughtfully and said, "If the three elders can't wait for me in Kansel, they will leave there sooner or later. Once they leave, the Grand Commander of the Right Army Governor's Office will naturally not stay. If I can lock him, I can track him to the headquarters of the Right Army Governor's Office and find a chance to kill him!"

...

Right now.

Kansel Petroleum Company Limited, Lagos, Nigeria.

Countless kowtow machines were still running on the plain. Wu Shutong, the Grand Commander-in-Chief of the Right Army Governor's Office, once again stood on the high platform. Standing behind him was still his confidant, Lieutenant General Andre.

Wu Shutong stood in front of the railing, staring at the vast plain, and suddenly sneezed.

He rubbed his nose in surprise and said in annoyance: "It's so hot, why did you sneeze? Although I'm not as strong as the four earls, I won't catch a cold, right?"

the Amazing Son In Law Chapter 6985

By [_](#) / August 17, 2024

Wu Shutong could never have dreamed that while he was spending his days in the oil fields of Nigeria, the satellites on the skyline had already begun to take intensive photos of the area where he was as much as possible.

In order to seize the rare opportunity to show off and leave a good impression on Charlie, Lord Banks, the old man of the Banks family, acquired the largest vending machine company in Nigeria as quickly as possible. He only spent more than 200,000

US dollars on public relations fees to bribe the heads of the Lagos airport, dock, and station, and increased the number of vending machines here by at least double.

Among them, the airport manager gave the green light to the placement of vending machines after receiving a bribe of 50,000 US dollars.

As a result, the density of vending machines at Lagos Airport is now the largest in the world. From the entrance to the airport lobby, to each row of check-in counters, and to almost all boarding gates, there is a vending machine selling various beverages and items that will be used during the flight.

After all these are covered, as long as this person enters the airport, no matter where he goes, he will be photographed by the surveillance cameras of more than one vending machine.

However, the VIP building is relatively special because it does not have the same entrance as the airport's main terminal.

When preparing to put vending machines in the VIP terminal, Mr. banks felt a sense of disharmony. He told Zara banks his concerns on the phone and said, "Zara , the VIP terminal here has free catering services, and all kinds of drinks and alcohol are available for free. Putting vending machines here feels a bit strange, like taking off your pants to fart, so do you think you should ask Mr. Wade for permission?"

Zara banks said to him without thinking, "Grandpa, although I don't know why Mr. Wade wants to make vending machines, since Mr. Wade asked you to put as much as possible, you have to try your best to make sure there are no blind spots. As for the VIP waiting room, I think you can change your thinking. You can talk to the person in charge and tell him that in the future, all the drinks in the VIP waiting room will be provided free of charge by your vending machines. In return, you hope to add an LCD screen to our vending machine to display advertisements for these high-net-worth VIP users. We will use the advertising fees to subsidize the cost of the vending machine."

"Oh..." Mr. banks suddenly realized and blurted out, "This model seems to be quite common on the Internet. Many content that was originally paid for can be made free by just watching advertisements."

"Yes." Zara banks said, "Those who can go to the VIP terminal are basically the highest-end customers of the airport services. These customers have a very high net worth, so the value of the advertisements shown to them is much higher than that shown to the middle- and low-income people on the Internet. Maybe by just taking some advertisements for high-end luxury brands, the advertising fees can easily cover the material costs of the vending machine operations, and even easily make a profit. So this business logic is also feasible and reasonable, and naturally it will not arouse suspicion."
