The Amazing son in law Chapter 8058

Steve's words made charlie take the computing power business seriously for the first time.

According to Steve, computing power has become the most sought-after resource in the world, and also the one with the greatest potential for value retention and even appreciation.

Moreover, the AI computing power center that he had unintentionally developed to deal with the Qing Dynasty and Sara has now become a hot commodity. Given this, he certainly couldn't miss such a good opportunity.

So, charlie asked Steve, "Let's not talk about renting out computing power for now. If I want to build another computing power center now, what do you think is the best approach?"

Steve replied truthfully, "Mr. Ye, building a computing power center now isn't about money, it's about the supply. High-end computing graphics cards are in short supply, and the waiting list is much more severe than before. Moreover, Nvidia has been forced to publicly announce its production schedule, so even we can't jump the queue now. Therefore, if you want to build such a large-scale computing power center now, the cost will naturally be ten times higher or even more. Because now, if you want to buy cards, you have to pay an outrageously high price, so high that the person who gets the cards feels that they might not even make as much money as selling them to you if they keep them." "Considering the sale, a set of high-end computing cards, starting at $300,000, has now risen to over three million, almost four million US dollars. Only by offering such a high premium can we possibly acquire enough cards to establish a new computing center."

charlie frowned and said, "So shady?"

Steve could only explain, "That's just the market price. This stuff is in short supply. Everyone's scrambling to buy it. Companies like Meta,

OpenAI, and Claude are spending hundreds of billions of dollars buying computing cards all over the world. Oh, and there's Musk too. That kid's riding high right now. If he keeps showing off for a while, his personal wealth will probably surpass that of the Rothschild family."

charlie couldn't help but click his tongue.

For him, he was naturally happy to encounter such a coincidence, but he absolutely couldn't accept being ripped off.

Even if the current market price was ten times higher, he still felt it was too much of a rip-off.

Steve continued, "But Mr. Ye, even if it were easy to set up the cards now, it would be difficult for your computing center to expand further."

charlie asked curiously, "Why?"

Steve explained, "The power supply in Northern Europe and even the whole of Europe is very tight. A computing center is basically a giant power shredder. They don't have such a strong power supply locally, so even if you have the cards, they can't run."

charlie exclaimed, "It's the 21st century, and Europe still has a power shortage?"

Steve chuckled and said, "Oh, you might not know this, but Europe didn't used to have a power shortage. But then they started environmental protection, and everyone stopped doing their jobs properly, damn it..." "That bunch of idiots protest at the sight of coal-fired power plants, and they practically want to devour nuclear power plants. Traditional coal-fired and nuclear power generation are severely restricted. The key issue is that they can't even develop clean energy. In winter, many countries don't even have enough natural gas for heating, let alone enough energy to supply electricity. Look at the Germans, they're even more ridiculous. They built nuclear power plants, and as soon as there was a protest, they simply stopped using them and turned

around to buy French nuclear power at high prices. It feels like these people are just putting on performance art."

charlie sighed, "Oh, now that you mention it, I'm reminded of that environmental activist. She and her cronies deserve a lot of credit for Europe becoming what it is today."
