

## **Imitator 145**

### Chapter 145: Establishing Finance

The three parties reached consensus, with Luo Wei beginning to formulate specific wealth adjustment plans.

After all, her profession was actuary, making her most skilled at this type of work.

This level of adjustment plan was a piece of cake for her.

Han Mengying was also observing her with great interest. Obviously, this profession was considered rare talent in any community.

The final adjustment plan wasn't complex:

Currently, Community 12 had the most wealth. If the three communities wanted to complete a 2:1:1 distribution, Community 4 and Community 17 would definitely need to divide Community 12's wealth.

Community 4 and Community 17 would divide the four work buttons in the 4th round of the game.

Community 12 would also need to invest once each in Community 4 and Community 17.

This way, before the 4th round ended, the three communities could complete preliminary wealth ratio balancing.

Each community would temporarily not invest internally to avoid causing proportional chaos.

Han Mengying, as a Conglomerate, also needed to consolidate her rule: she would ensure Qi Fan's wealth value was highest among 'Adult' players through investment and inheritance.

This way, after Han Mengying died, Qi Fan would 100% become the sole 'Old Age' management member.

In subsequent rounds, the three communities would continue earning money while making such adjustments, with the ultimate goal of ensuring the three communities' wealth ratios always maintained 2:1:1.

Any community whose wealth value exceeded this ratio would need to transfer excess visa time to communities with lower ratios through investment.

Of course, to better prove her value, Luo Wei also calculated some additional details, though they weren't very significant.

From the results, this distribution method was a division of Community 12's wealth.

So Fan Zehui was initially unwilling, still harboring fantasies of using their current total wealth advantage to attempt reclaiming Conglomerate status but there were many smart people present who, after simple analysis, made Fan Zehui abandon such fantasies.

Fan Zehui lost Conglomerate status because he mistakenly listened to Han Mengying's advice and dispersed wealth for optimal investment efficiency.

Han Mengying rose to power by exploiting loopholes and naturally wouldn't make such elementary mistakes again.

Before her death, she would definitely concentrate wealth as much as possible through investment and inheritance, ensuring Community 4 had 1 'Old Age' player and 1 'Adult' player entering management.

In extreme circumstances, Han Mengying could completely maximize all Civilian taxes, interrupting any attempts at wealth concentration.

After explanations, Fan Zehui could only completely abandon such fantasies.

...

After completing the preliminary balancing plan, Cai Zhiyuan proposed a new suggestion.

"I think the current plan is already quite comprehensive, but in specific execution, it might be somewhat complex with room for optimization.

"Simply put, since each game round has investment return limits, and different return distribution methods can be chosen when investing, if everyone acts freely, the calculation volume would be enormous and error-prone.

"If 'investment collisions' occur, where investment vouchers needing exchange in the same round exceed return limits, these vouchers would expire. Such losses are unacceptable.

"Our community having an actuary means we're not too worried about such situations, but your two communities' data could still have problems, affecting efficiency.

"So I thought of a better method:

"According to game rules, one can simultaneously invest in multiple players and simultaneously accept investments from multiple players.

"Our three communities each designate one internally trusted player as 'Finance.' The other three people in each community prioritize investing in them, concentrating wealth in their hands.

"When a community's wealth obviously exceeds the established ratio, property is primarily transferred from the community finance. That is, having this player invest one to four times in communities with lower ratios.

"Through different investment plans, investment returns are subdivided.

"When the finance lacks sufficient wealth, other players with more wealth can simultaneously invest in them for quick replenishment.

"Concentrating investment behavior makes wealth ratio balancing easier to complete, greatly reducing calculation volume and avoiding losses from investment collisions."

Everyone considered this for a while and felt it was a good suggestion.

If every player invested and transferred money among each other, the relationships among 12 people would become very chaotic with excessive calculation volume.

There might be situations where some rounds couldn't maximize investment returns while other rounds had large numbers of investment vouchers expire.

Though careful calculation could clarify things, each game round only had 10 minutes, which would be very time-consuming.

If 'Finance' was established, whether internal community wealth appreciation or external community wealth exchange would become much more convenient.

Even if severe imbalances occurred between communities, as long as this finance invested four times in another community's four players, ratios could be quickly balanced.

Investment vouchers would clearly state the investee and return distribution method, making confirmation easy.

As for internal community funding imbalances, this wasn't too serious a problem since community members were all allies who trusted each other.

Internal community wealth adjustments could be made during the final two or three game rounds.

Han Mengying initially worried that this 'Finance' concentrating wealth might affect Conglomerate management but thinking carefully, this possibility almost didn't exist.

Because Conglomerate players' wealth ratio was 50%, occupying an absolute advantageous position.

No one could cover identity cards. Han Mengying didn't need to work and could constantly monitor everyone's wealth values, ensuring they stayed within safe ranges.

Once any community deviated from the 2:1:1 ratio, it could be quickly discovered with emergency measures taken, such as taxing Civilians.

Ultimately, both Han Mengying and Fan Zehui agreed to this plan.

Cai Zhiyuan naturally said, "Good, then our community will have Lawyer Lin serve as 'Finance.'"

Han Mengying frowned and instinctively said, "No."

Cai Zhiyuan countered, "Why not? Finance is chosen by the community itself."

Han Mengying was highly vigilant, "According to your description, this so-called 'Finance' is just simple work. Does it need Mr. Lin's brilliant mind?"

"If you have Mr. Lin serve as finance, I'll suspect you have some special plan."

"If it's truly as you said and this work is simple, then I can only accept Qin Yao serving as 'Finance.'"

Qin Yao was stunned, "Ah? Me?"

Cai Zhiyuan didn't mind, "Of course that's fine, but in that case, shouldn't your community's candidate also be chosen by us?"

"You also cannot serve as 'Finance.'"

Han Mengying was silent for a moment, then stepped aside, "Fine, pick whoever you want."
