

KRYPTONIAN: MAN OF STEEL

Chapter 2 Study Yourself

As a foreigner, Luther naturally had no idea of getting an American green card or naturalization.

On the contrary, he used this large "inheritance" to invest in the stock market and go to Las Vegas Casino openly.

While winning a large sum of money, Luther was still thinking about a question, why Clark Kent, who also has a super brain, lives so poor?

His adoptive parents were worried about the farm, but they couldn't pay, and the house was about to be taken away by the bank. It was Batman who bought the bank to save them.

I don't want to expose my power, but it doesn't matter if I'm a little "smart", right?

Just like now, Luther casually won a billion dollars with a few million dollars in Las Vegas Casino.

Not only did Las Vegas not embarrass him, but it even sent a team of bodyguards to follow and protect him throughout the whole process, and also arranged a high-end security hotel for him to live in.

After all, the casino is actually very happy that you can win big money. This is equivalent to a living signboard, which will attract more gamblers to come, and the money earned from them can be recovered quickly, and can be multiplied several times.

As for arranging bodyguards, it was even simpler. It was nothing more than worrying that competitors would deliberately make trouble and frame the casino.

This made Luther very depressed. He thought there would be a classic drama, but he didn't expect it to be an unexpected development.

However, he used the billion dollars to start speculating in stocks. Of course, Luther didn't do it too much, because if he was invincible, he would be targeted.

Wall Street regulators and the FBI are very strict about illegally obtaining insider information of securities and making profits from it.

Luther was very cautious. He only invested after learning and analyzing data.

Then his billion dollars became 2.5 billion US dollars. After this, Luther did not continue to speculate in stocks.

Instead, he chose to start a company.

He turned to studying and researching biological genes. After all, Luther's heart was not that big. He calmly accepted that Kryptonians would not have any problems with acclimatization when they crossed into the Marvel world. He was worried that there would be problems in the microscopic field that were difficult to observe.

God knows if that unknown existence gave him the concept of a universal version of Kryptonians in the Marvel world?

If not, he didn't want to die in obscurity.

...

"Boss, you are the most talented person I have ever seen, an unprecedented genius!"

With a capital injection of 2 billion US dollars, "Monarch" was established.

The company name comes from the "Monarch Organization" in the Godzilla series.

Luther's first step was to find the scientific research leaders in the field of biological genes, invite them to join the company or become his teachers, and then Luther learned their knowledge at an astonishing speed. Anyway, there was already a Tony Stark who became a thermonuclear astrophysicist in just one night, so he was not amazing.

"Professor Landa, thank you for your guidance."

Luther smiled and nodded.

He spent a month studying, and now he can say that he has completed the knowledge summary in the field of biological genes. If he has the thinking of a scientific researcher, he can definitely become a super scientific researcher. Unfortunately, Luther has no idea of cultivating his own way of thinking and pattern.

Because of his nationality and race, Monarch Company cannot get the advanced instruments in various biological laboratories. The American technical level in this regard is locked.

But it doesn't matter. Luther himself is a super machine that surpasses all human instruments.

Super vision is more advanced and powerful than all human observation techniques, and the computing and analysis capabilities of the super brain also surpass those of supercomputers.

It was just difficult to extract cells. Luther had awakened the Iron Body and the Bio-Force Field, which made his own physical resistance maxed out. In addition, after so many days of sun exposure, it was hard to say whether he

could withstand nuclear bombs. At least he was confident that missiles could not break his defense.

In the end, he still found a way to extract his own cells and began to study the various reactions of his cells in the sun.

This lasted for a year. During this process, Luther sealed himself up and prohibited exposure to sunlight.

"... Sample No. 115, in good condition."

"Sample No. 191, in good condition."

"Sample No. 239, in good condition."

Luther put down the data and breathed a sigh of relief.

For a year, various samples were exposed to sunlight of different durations, environments, and intensities.

The result was that all samples survived and did not show any adverse changes.

The cells of Kryptonians are very active and can survive as long as there is sunlight.

Luther was exposed to the sun again after a long absence and stretched his body comfortably.

In one year, the Emperor Building, which cost \$500 million, has been completed. Compared with the Stark Building, which will cost \$600 million in the future, the Emperor Building is more defensive, with a main steel structure, concrete wrapped steel, alloy bottom layer, etc., so it is very expensive.

Since the construction began, the Emperor Company has been losing money. After all, Luther has only stayed in his own laboratory until now, and no one knows what he does.
