Chapter 6: Equipment

After hearing his confirmation Spector android left the room for a few minutes before returning carrying two black cases that seemed to be made of some kind of metal.

Spector android placed the cases on the table before saying, "As you are still not the Spector operator you are only cleared to use certain equipment."

Spector android opened one of the cases and Adam saw that it contained dark clothing.

"This clothing has been manufactured using current Earth trends since wearing Solarian equipment would make you stand out more, however it still possesses the same functionality."

"All clothing is equipped with nanoweave technology that is capable of stopping any sharp or ballistic objects that attempt to pierce them."

"The nanoweave also provides security camera disruption which means that your body will be blurred out on any security camera footage of you."

"The jacket comes equipped with a hood that has the special ability of completely hiding your face from anyone looking at you, the only way for them to identify you is to remove said hood."

"Additionally when you have the hood up and you stand in dark or shadowy places you will become invisible to the naked eye, be warned that this function will have no effect against any equipment that detects heat or thermal signatures such as night vision goggles and also the cloaking ability will be disabled if any light source touches the clothing."

"The gloves nanoweave technology gives them the ability to bypass any hand or fingerprint scanners by duplicating the correct biometrics. As we are on the topic of security scanners, your replacement retina has the ability to bypass retinal scanners by duplicating the required retina."

"They both cycle through billions of variations until they find the correct one, all within a fraction of a second."

As she spoke, Spector android removed from the case and lay on the table a trench coat with hood, t-shirt, jeans, gloves, trainers and some kind of utility belt.

Spector android then moved over to open the other case which contained several pieces of equipment and a black gun.

"First you need to equip this uniband" Spector android said as she held up what to Adam looked like a dark bangle.

"This uniband will automatically adjust to your wrist size and comes with many functions, only some of which I will explain now."

"First it essentially replaces your basic communications device as it gives you the function to call, message and email people in your contact list. Naturally that does not include me since you are now linked to Spector via your neurolink, any long distance communication between ourselves will be done through your neurolink via your HUD."

"Next it gives you the ability to hack into any terminal or electronic door lock either by holding your uniband in front of said device if its security is low level or by holding the uniband in front of an access point you wish to use allowing it to scan the access port and provide you with an appropriate connector."

"Here we have a Phalanx MK7 self recharging blaster pistol." Spector android said holding up the black gun.

The blaster looked like a cross between a revolver and a semi automatic pistol. The rear part including the handle and cylinder looked like a revolver.

However instead of having six chambers for bullets like a normal cylinder, this one only had four and you could not see into them, also where the hammer should have been there was instead a circular light indicator with four sections though only one section was currently illuminated.

The front half looked like a semi automatic pistol however the barrel was longer and had a second section underneath which seemed to be a aiming laser.

"Because this is a blaster pistol you have no need to worry about equipping a suppressor since it is naturally quiet."

As if to prove her point, Spector android aimed the laser pistol at the far wall and pulled the trigger. A red energy bolt left the barrel along with a "buzz" sound before leaving a scorch mark on the wall.

However Adam noticed that the wall seemed to repair itself after a second and the scorch mark disappeared.

"The MK7 has four settings that can be cycled through by rotating between the four cylinder sections and causing the light indicator to change appropriately; the number of indicator lights represents the lethality. One light represents stun mode, in this mode a shot from the MK7 will knock unconscious most lifeforms, be aware that the genetic makeup and physical fitness of the target does determine how effective the stun shot is and also how long they are unconscious for."

"Two lights represent maim damage, this mode is designed for if you just want to injure and not kill or if you need to forcibly extra information from a target through pain."

"Three lights is kill mode, in this mode most lifeforms will die from a single shot, once again however genetic makeup and physical fitness of the target does determine how effective the shot will be, to be certain of a kill show it is still best to aim for the head."

"Four lights indicates disintegration mode, this mode is used if you want to disintegrate a person or object for uses such as getting rid of evidence, or saving you the trouble of hiding that pesky dead body you just killed."

This time Spector android aimed the MK7 at the now empty case that previously had the clothes before rotating the cylinder until all four sections of the light indicator circle where illuminated after which she pulled the trigger.

A much larger red energy bolt than previously left the barrel along with a "buzz" and as soon as it hit the empty case disappeared completely.

"As you saw and I'm sure you can guess the more lethal the shot the more power it drains from the MK7, however as I said before the MK7 is self recharging so given a short period of time it will passively recharge."

"As you're aware from your training any weapon you have equipped will show up on your HUD along with remaining ammo or energy as well as what setting is currently selected."

After putting down the MK7, Spector android picked up a cylinder before pressing a button on the side after which a red energy beam of about five inches appeared at one end of the cylinder.

"A LIGHTS..." Adam began but before he could finish Spector android cut him off.

"This is a beam sabre with the ability to change the length of the energy beam."

To show what she meant she moved a slider that was embedded into the hilt so that it wouldn't get into the way of the user's grip and the energy blade grew in length to around three feet after which she turned the beam off.

"All weapons are made out of a special alloy that will make them invisible to any weapon or metal detectors, they can of course still be felt if you allow someone to frisk you however."

"Next we have."
